Abstract:

QCD recursion relations and the largest time equation

Diana Vaman
MCTP, University of Michigan

Based on: hep-th/0512031(JHEP) by D.V. and Ed Yao

Perimeter Institute, Waterloo, May 2006

Outline

- Introduction
- The space-cone gauge
- QCD and the recursion relations: examples
- Tree level recursion relations and the largest time equation
- The general proof
- Including fermions and tree level recursion relations
- Conclusions and future directions

Introduction

Over the last couple of years great strides have been made to simplify the standard perturbative approach to QCD calculations

- Witten's formulation of perturbative $N=4$ QCD as a string theory on twistor space
- MHV rules as a way to expedite perturbative calculations
- BCFW *on-shell* recursion relations

...

It is obvious that the on-shell recursion relations bear on the cutting rules in field theory.

In fact, cut-constructibility has been reliably used to compute loop amplitudes over the last decade. The unitarity of the S-matrix and the existence of an ordering among a sequence of points ([largest time equation](#)) are intimately related.

The question is: which particular formulation of QCD and which particular ordering are the most suited for a field theoretical derivation of the on-shell recursion relations?

Introduction

Over the last couple of years great strides have been made to simplify the standard perturbative approach to QCD calculations

- Witten's formulation of perturbative $N=4$ QCD as a string theory on twistor space
- MHV rules as a way to expedite perturbative calculations
- BCFW *on-shell* recursion relations

...

It is obvious that the on-shell recursion relations bear on the cutting rules in field theory.

In fact, cut-constructibility has been reliably used to compute loop amplitudes over the last decade. The unitarity of the S-matrix and the existence of an ordering among a sequence of points ([largest time equation](#)) are intimately related.

The question is: which particular formulation of QCD and which particular ordering are the most suited for a field theoretical derivation of the on-shell recursion relations?

The answer is: [the space-cone gauge QCD, and a light-like ordering](#).

...and Summary

- We offer a purely quantum field theoretical proof (at the level of Feynman diagrams) of the BCFW recursion relations.
- A key ingredient is the use of space-cone gauge.
- The tree level recursion relations emerge at a more fundamental level from the largest time equation.
- Our results lend themselves to natural generalizations to include massive scalars and fermions.

Setting notation

A 4-component Lorentz vector can be written as a bispinor as

$$V_{a\dot{a}} = V_\mu \sigma^\mu_{a\dot{a}} = \frac{1}{\sqrt{2}} \begin{pmatrix} V_0 + V_3 & V_1 - iV_2 \\ V_1 + iV_2 & V_0 - V_3 \end{pmatrix} = \begin{pmatrix} v^+ & \bar{v} \\ v & v^- \end{pmatrix}$$

The inner product of 2 vectors is given by

$$V \cdot U = V^{a\dot{a}} U_{a\dot{a}}$$

and the norm is $-\det(V)$.

The basic principle of twistors is that a null vector \equiv the square of a commuting spinor

$$V^2 = 0 \implies V_{a\dot{a}} = v_a v_{\dot{a}}$$

Notation: $\langle vu \rangle = v^a u_a$, $[vu] = v^{\dot{a}} u_{\dot{a}}$, $UV = \langle vu \rangle [vu]$.

The space-cone gauge

The Yang-Mills gauge field can be decomposed in a light-cone basis as

$$A^\mu = (a, \bar{a}, a^+, a^-)$$

In a twistor basis $|+\rangle, |+\rangle, |-\rangle, |-\rangle$, these components read

$$A = a^+ |+\rangle\langle +| + a^- |-\rangle\langle -| + a |-\rangle\langle +| + \bar{a} |+\rangle\langle -|$$

The Yang-Mills theory Lagrangean

$$L = -\frac{1}{8} \text{Tr}(\partial^\mu A^\nu - \partial^\nu A^\mu + i[A^\mu, A^\nu])^2.$$

yields the simplest Feynman diagrams in the space-cone gauge

$$N \cdot A = 0, \text{ with } N = |+\rangle\langle -| \Rightarrow a = 0$$

Chalmers, Siegel '98

The space cone gauge-fixed Yang-Mills Lagrangean is given by

$$\begin{aligned} \mathcal{L} = & \text{Tr} \left[\frac{1}{2} a^+ \square a^- - i \left(\frac{\partial^-}{\partial} a^+ \right) [a^+, \partial a^-] - i \left(\frac{\partial^+}{\partial} a^- \right) [a^-, \partial a^+] \right. \\ & \left. + [a^+, \partial a^-] \frac{1}{\partial^2} [a^-, \partial a^+] \right]. \end{aligned}$$

where a^+ corresponds to a positive helicity gluon and a^- to a negative helicity one.

The twistor basis is selected such that an external positive helicity gluon has momentum

$$P = |-\rangle[-|$$

and another one, with negative helicity, has momentum

$$Q = |+\rangle[+|.$$

(It is useful, but not necessary that two opposite helicity external gluons be selected to define the twistor basis.)

The space-cone gauge

The Yang-Mills gauge field can be decomposed in a light-cone basis as

$$A^\mu = (a, \bar{a}, a^+, a^-)$$

In a twistor basis $|+\rangle, |+\rangle, |-\rangle, |-\rangle$, these components read

$$A = a^+ |+\rangle\langle +| + a^- |-\rangle\langle -| + a |-\rangle\langle +| + \bar{a} |+\rangle\langle -|$$

The Yang-Mills theory Lagrangean

$$L = -\frac{1}{8} \text{Tr}(\partial^\mu A^\nu - \partial^\nu A^\mu + i[A^\mu, A^\nu])^2.$$

yields the simplest Feynman diagrams in the space-cone gauge

$$N \cdot A = 0, \text{ with } N = |+\rangle\langle -| \Rightarrow a = 0$$

Chalmers, Siegel '98

Setting notation

A 4-component Lorentz vector can be written as a bispinor as

$$V_{a\dot{a}} = V_\mu \sigma^\mu_{a\dot{a}} = \frac{1}{\sqrt{2}} \begin{pmatrix} V_0 + V_3 & V_1 - iV_2 \\ V_1 + iV_2 & V_0 - V_3 \end{pmatrix} = \begin{pmatrix} v^+ & \bar{v} \\ v & v^- \end{pmatrix}$$

The inner product of 2 vectors is given by

$$V \cdot U = V^{a\dot{a}} U_{a\dot{a}}$$

and the norm is $-\det(V)$.

The basic principle of twistors is that a null vector \equiv the square of a commuting spinor

$$V^2 = 0 \implies V_{a\dot{a}} = v_a v_{\dot{a}}$$

Notation: $\langle vu \rangle = v^a u_a$, $[vu] = v^{\dot{a}} u_{\dot{a}}$, $UV = \langle vu \rangle [vu]$.

The space-cone gauge

The Yang-Mills gauge field can be decomposed in a light-cone basis as

$$A^\mu = (a, \bar{a}, a^+, a^-)$$

In a twistor basis $|+\rangle, |+\rangle, |-\rangle, |-\rangle$, these components read

$$A = a^+ |+\rangle\langle +| + a^- |-\rangle\langle -| + a |-\rangle\langle +| + \bar{a} |+\rangle\langle -|$$

The Yang-Mills theory Lagrangean

$$L = -\frac{1}{8} \text{Tr}(\partial^\mu A^\nu - \partial^\nu A^\mu + i[A^\mu, A^\nu])^2.$$

yields the simplest Feynman diagrams in the space-cone gauge

$$N \cdot A = 0, \text{ with } N = |+\rangle\langle -| \Rightarrow a = 0$$

Chalmers, Siegel '98

The space cone gauge-fixed Yang-Mills Lagrangean is given by

$$\begin{aligned}\mathcal{L} = & \text{Tr} \left[\frac{1}{2} a^+ \square a^- - i \left(\frac{\partial^-}{\partial} a^+ \right) [a^+, \partial a^-] - i \left(\frac{\partial^+}{\partial} a^- \right) [a^-, \partial a^+] \right. \\ & \left. + [a^+, \partial a^-] \frac{1}{\partial^2} [a^-, \partial a^+] \right].\end{aligned}$$

where a^+ corresponds to a positive helicity gluon and a^- to a negative helicity one.

The twistor basis is selected such that an external positive helicity gluon has momentum

$$P = |- \rangle [-|$$

and another one, with negative helicity, has momentum

$$Q = | + \rangle [+ |.$$

(It is useful, but not necessary that two opposite helicity external gluons be selected to define the twistor basis.)

$$P =$$

$$\frac{1}{\partial} (e^{iPx} \dots) =$$

$\frac{1}{\partial} \dots$

$$P = (p, \bar{\Phi}, p^T, p^-)$$

$$\frac{1}{\partial} (e^{i P \cdot X} \dots) =$$

γ_n

$$P = (p, \bar{\phi}, p^T, p^-)$$

$$\frac{1}{\phi} (e^{iP \cdot X} \dots) = \frac{1}{\phi}$$

$$A + \frac{C}{g^n}$$

$$ds^2 = -dt^2 + g_{\mu\nu} dx^\mu dx^\nu + e^{2\sigma} dy^2$$

$$V = A_{(1)}$$

The space cone gauge-fixed Yang-Mills Lagrangean is given by

$$\begin{aligned} \mathcal{L} = & \text{Tr} \left[\frac{1}{2} a^+ \square a^- - i \left(\frac{\partial^-}{\partial} a^+ \right) [a^+, \partial a^-] - i \left(\frac{\partial^+}{\partial} a^- \right) [a^-, \partial a^+] \right. \\ & \left. + [a^+, \partial a^-] \frac{1}{\partial^2} [a^-, \partial a^+] \right]. \end{aligned}$$

where a^+ corresponds to a positive helicity gluon and a^- to a negative helicity one.

The twistor basis is selected such that an external positive helicity gluon has momentum

$$P = |- \rangle [-|$$

and another one, with negative helicity, has momentum

$$Q = |+\rangle [+|.$$

(It is useful, but not necessary that two opposite helicity external gluons be selected to define the twistor basis.)

The external line factors have to be supplied, such that $\epsilon \cdot P = 0$.

We have:

$$\epsilon_+ = \frac{|+\rangle[p]}{\langle p+ \rangle}, \quad \epsilon_- = \frac{|p\rangle[-]}{[-p]}$$

This implies $(\epsilon_+)^+ = \frac{[-p]}{\langle +p \rangle}$ and $(\epsilon_-)^- = \frac{\langle +p \rangle}{[-p]}$.

Notice that for the reference gluons

$$p^- = 1, \quad q^+ = 1, \quad (\epsilon_p)^+ = [-p] = 0, \quad (\epsilon_q)^- = \langle +q \rangle = 0.$$

The external line factors have to be supplied, such that $\epsilon \cdot P = 0$.

We have:

$$\epsilon_+ = \frac{|+\rangle[p]}{\langle p+ \rangle}, \quad \epsilon_- = \frac{|p\rangle[-]}{[-p]}$$

This implies $(\epsilon_+)^+ = \frac{[-p]}{\langle +p \rangle}$ and $(\epsilon_-)^- = \frac{\langle +p \rangle}{[-p]}$.

Notice that for the reference gluons

$$p^- = 1, \quad q^+ = 1, \quad (\epsilon_p)^+ = [-p] = 0, \quad (\epsilon_q)^- = \langle +q \rangle = 0.$$

The external line factors have to be supplied, such that $\epsilon \cdot P = 0$.

We have:

$$\epsilon_+ = \frac{|+\rangle[p]}{\langle p+ \rangle}, \quad \epsilon_- = \frac{|p\rangle[-]}{[-p]}$$

This implies $(\epsilon_+)^+ = \frac{[-p]}{\langle +p \rangle}$ and $(\epsilon_-)^- = \frac{\langle +p \rangle}{[-p]}$.

Notice that for the reference gluons

$$p^- = 1, \quad q^+ = 1, \quad (\epsilon_p)^+ = [-p] = 0, \quad (\epsilon_q)^- = \langle +q \rangle = 0.$$

However, in the vertices with a reference gluon we also need to evaluate

$$(\epsilon_p)^+ \times p^- / p = \frac{[-p]}{[-p]} = 1.$$

The lesson: the reference gluons (+) participate only in (++) 3-point vertices and the vertex is equal to k, where K is a negative helicity gluon.

Example: A 3-point function

Consider $(++ -) = (123)$. Select the reference null vectors the momenta P_1 and some arbitrary $P_4 = |+\rangle[+|$. The answer is

$$(++ -) = p_3 \epsilon_2^+ \epsilon_3^- = \frac{[12]^3}{[23][31]}$$

Example: A 4-point function

Consider $(+ - - +) = (1234)$. Select the reference vectors $P_1 = |-\rangle[-|$ and $P_2 = |+\rangle[+|$.

$$(+- -+) = \frac{1}{P_{14}^2} p_{14}^2 \epsilon_3^- \epsilon_4^+ = \frac{[12]^3}{[23][34][41]}$$

$$\frac{\phi}{m_p} \sim \ln\left(\frac{b}{b_0}\right)$$

$$\frac{\Phi}{m_p} \sim \ln\left(\frac{b}{l}\right)$$

Example: A 3-point function

Consider $(++-) = (123)$. Select the reference null vectors the momenta P_1 and some arbitrary $P_4 = |+\rangle[+|$. The answer is

$$(++) = p_3 \epsilon_2^+ \epsilon_3^- = \frac{[12]^3}{[23][31]}$$

Example: A 4-point function

Consider $(+- -+) = (1234)$. Select the reference vectors $P_1 = |-\rangle[-|$ and $P_2 = |+\rangle[+|$.

$$(+- -) = \frac{1}{P_{14}^2} p_{14}^2 \epsilon_3^- \epsilon_4^+ = \frac{[12]^3}{[23][34][41]}$$

QCD and tree level on-shell recursion relations

The on-shell recursion relations (BCFW) state:

$$\mathcal{A}(P, \{P_i\}, Q, \{Q_j\}) = \sum_{i,j} \mathcal{A}_L(\hat{P}, \{P_i\}) \frac{1}{(P + \sum_i P_i)^2} \mathcal{A}_R(\hat{Q}, \{Q_j\}),$$

where $\mathcal{A}_L, \mathcal{A}_R$ are lower n-point functions obtained by isolating two reference gluons with shifted momenta, $\hat{P} = P - z\eta$, $\hat{Q} = Q + z\eta$ with $\eta^2 = \eta \cdot P = \eta \cdot Q = 0$, on the two sides of the cut. The shifting of the two external momenta is necessary in order to preserve energy-momentum conservation.

Britto, Cachazo, Feng, Witten '05

$$\left\{ \begin{array}{l} P = |+\rangle \langle -| \\ Q = |-\rangle \langle -|; \quad Q = |+\rangle \langle +| \end{array} \right.$$

QCD and tree level on-shell recursion relations

The on-shell recursion relations (BCFW) state:

$$\mathcal{A}(P, \{P_i\}, Q, \{Q_j\}) = \sum_{i,j} \mathcal{A}_L(\hat{P}, \{P_i\}) \frac{1}{(P + \sum_i P_i)^2} \mathcal{A}_R(\hat{Q}, \{Q_j\}),$$

where $\mathcal{A}_L, \mathcal{A}_R$ are lower n-point functions obtained by isolating two reference gluons with shifted momenta, $\hat{P} = P - z\eta$, $\hat{Q} = Q + z\eta$ with $\eta^2 = \eta \cdot P = \eta \cdot Q = 0$, on the two sides of the cut. The shifting of the two external momenta is necessary in order to preserve energy-momentum conservation.

Britto, Cachazo, Feng, Witten '05

Using the cutting rules which follow from the largest time equation and from the space-cone gauge QCD Lagrangean we provided a direct proof of the BCFW recursion relations.

DV, Ed Yao '05

QCD and tree level on-shell recursion relations

The on-shell recursion relations (BCFW) state:

$$\mathcal{A}(P, \{P_i\}, Q, \{Q_j\}) = \sum_{i,j} \mathcal{A}_L(\hat{P}, \{P_i\}) \frac{1}{(P + \sum_i P_i)^2} \mathcal{A}_R(\hat{Q}, \{Q_j\}),$$

where $\mathcal{A}_L, \mathcal{A}_R$ are lower n-point functions obtained by isolating two reference gluons with shifted momenta, $\hat{P} = P - z\eta$, $\hat{Q} = Q + z\eta$ with $\eta^2 = \eta \cdot P = \eta \cdot Q = 0$, on the two sides of the cut. The shifting of the two external momenta is necessary in order to preserve energy-momentum conservation.

Britto, Cachazo, Feng, Witten '05

Using the cutting rules which follow from the largest time equation and from the space-cone gauge QCD Lagrangean we provided a direct proof of the BCFW recursion relations.

DV, Ed Yao '05

Consider first the effect of the $z\eta$ shift of the external momenta on the vertices. Take the shifted external gluons to coincide with the reference external gluons.

$$P \longrightarrow \hat{P} = |- \rangle [-| + z\eta, \quad Q \longrightarrow \hat{Q} = |+ \rangle [+| - z\eta \\ \eta = |+ \rangle [-| \implies \hat{P}^2 = 0, \quad \hat{Q}^2 = 0$$

Consider first the effect of the $z\eta$ shift of the external momenta on the vertices. Take the shifted external gluons to coincide with the reference external gluons.

$$P \longrightarrow \hat{P} = |- \rangle [-| + z\eta, \quad Q \longrightarrow \hat{Q} = |+ \rangle [+| - z\eta \\ \eta = |+ \rangle [-| \implies \hat{P}^2 = 0, \quad \hat{Q}^2 = 0$$

The effect on components

$$\hat{p}^- = \langle + | \hat{P} | + \rangle = 1, \quad \bar{\hat{p}} = \langle - | \hat{P} | + \rangle = -z \\ \hat{q}^+ = \langle - | \hat{Q} | - \rangle = 1, \quad \bar{\hat{q}} = z$$

Do these shifts change the vertices?

$$|\eta\rangle = |+\rangle[-1]$$

$$|\varphi\rangle = |-\rangle[-1]; |\eta\rangle = |+\rangle[+1]$$

$$P = (p, \bar{p}, p^+, p^-)$$

$$(e^{iPX})$$

$$P \rightarrow \hat{P} = P + \epsilon \eta$$

QCD, w. deriv. couplings

Consider first the effect of the $z\eta$ shift of the external momenta on the vertices. Take the shifted external gluons to coincide with the reference external gluons.

$$P \longrightarrow \hat{P} = |- \rangle [-| + z\eta, \quad Q \longrightarrow \hat{Q} = |+ \rangle [+| - z\eta \\ \eta = |+ \rangle [-| \implies \hat{P}^2 = 0, \quad \hat{Q}^2 = 0$$

The effect on components

$$\hat{p}^- = \langle + | \hat{P} | + \rangle = 1, \quad \bar{\hat{p}} = \langle - | \hat{P} | + \rangle = -z \\ \hat{q}^+ = \langle - | \hat{Q} | - \rangle = 1, \quad \bar{\hat{q}} = z$$

Do these shifts change the vertices?

$$| \eta = | + \rangle [-1]$$

$$| \varphi = | - \rangle [-1]; Q = | + \rangle [+1] \rangle$$

$$P = (p, \vec{p}, p^+, p^-)$$

$$\frac{1}{\delta} (e^{i P \cdot X})$$

$$P \rightarrow \hat{P} = P + \epsilon \eta$$

QCD, w. deformed couplings

$$(\hat{P}) = \{ \hat{P}^- \}$$

The space cone gauge-fixed Yang-Mills Lagrangean is given by

$$\begin{aligned} \mathcal{L} = & \text{Tr} \left[\frac{1}{2} a^+ \square a^- - i \left(\frac{\partial^-}{\partial} a^+ \right) [a^+, \partial a^-] - i \left(\frac{\partial^+}{\partial} a^- \right) [a^-, \partial a^+] \right. \\ & \left. + [a^+, \partial a^-] \frac{1}{\partial^2} [a^-, \partial a^+] \right]. \end{aligned}$$

where a^+ corresponds to a positive helicity gluon and a^- to a negative helicity one.

The twistor basis is selected such that an external positive helicity gluon has momentum

$$P = |- \rangle [-|$$

and another one, with negative helicity, has momentum

$$Q = | + \rangle [+ |.$$

(It is useful, but not necessary that two opposite helicity external gluons be selected to define the twistor basis.)

Example: A 4-point function

Consider the same 4-point function $(+ - - +) = (1234)$ as before, and see what the recursion relation implies.

$$\begin{array}{c}
 \begin{array}{c}
 \text{1}^+ \\
 \diagup \\

 \diagdown \\
 \text{4}^+
 \end{array}
 \frac{1}{P_{14}^2}
 \begin{array}{c}
 \text{2}^- \\
 \diagup \\
 \text{---} \text{k}^+ \text{---} \\
 \diagdown \\
 \text{3}^-
 \end{array}
 \end{array}$$

Figure 1: Factorization of the 4-point function

Example: A 4-point function

Consider the same 4-point function $(+ - - +) = (1234)$ as before, and see what the recursion relation implies.

$$\begin{array}{c}
 \begin{array}{c}
 \text{1}^+ \\
 \diagup \\
 \text{---} \text{K} \text{---} \\
 \diagdown \\
 \text{4}^+
 \end{array}
 \begin{array}{c}
 \text{2}^- \\
 \diagup \\
 \text{---} \\
 \diagdown \\
 \text{3}^-
 \end{array}
 \end{array}
 =
 \begin{array}{c}
 \begin{array}{c}
 \text{1}^+ \\
 \diagup \\
 \text{---} \text{k} \text{---} \\
 \diagdown \\
 \text{4}^+
 \end{array}
 \begin{array}{c}
 \text{3}^- \\
 \diagup \\
 \text{---} \\
 \diagdown \\
 \text{3}^-
 \end{array}
 \end{array}
 \frac{1}{P_{14}^2}
 \begin{array}{c}
 \begin{array}{c}
 \text{2}^- \\
 \diagup \\
 \text{---} \text{k}^+ \text{---} \\
 \diagdown \\
 \text{3}^-
 \end{array}
 \end{array}$$

Figure 1: Factorization of the 4-point function

Example: A 4-point function

Consider the same 4-point function $(+ - - +) = (1234)$ as before, and see what the recursion relation implies.

$$\begin{array}{c}
 \begin{array}{c}
 \text{Diagram 1: Tree-level 4-point function with internal line } -K \\
 \text{Left vertex: } 1^+ \text{ (blue), } 4^+ \text{ (black) incoming; } 2^- \text{ (blue) outgoing} \\
 \text{Right vertex: } 2^- \text{ (blue), } 3^- \text{ (black) incoming; } 4^+ \text{ (black) outgoing}
 \end{array}
 =
 \begin{array}{c}
 \text{Diagram 2: Tree-level 4-point function with internal line } -k \\
 \text{Left vertex: } 1^+ \text{ (blue), } 4^+ \text{ (black) incoming; } 2^- \text{ (blue) outgoing} \\
 \text{Right vertex: } 2^- \text{ (blue), } 3^- \text{ (black) incoming; } 4^+ \text{ (black) outgoing}
 \end{array}
 \frac{1}{P_{14}^2}
 \begin{array}{c}
 \text{Diagram 3: Tree-level 4-point function with internal line } k^+ \\
 \text{Left vertex: } 1^+ \text{ (blue), } 4^+ \text{ (black) incoming; } 2^- \text{ (blue) outgoing} \\
 \text{Right vertex: } 2^- \text{ (blue), } 3^- \text{ (black) incoming; } 4^+ \text{ (black) outgoing}
 \end{array}
 \end{array}$$

Figure 1: Factorization of the 4-point function

Notice: the vertices are the same, multiplication with external line factors is the same, and on the internal line, now on-shell, $\epsilon_K^+ \epsilon_K^- = 1$. The factorization works trivially in this case.

Example: A 5-point function

Consider this time the 5-point function $(+++--)= (12345)$.

$$\begin{array}{c} +2 \\ \diagdown \\ -K+ \\ | \\ -L+ \\ / \\ +1 \end{array} \quad \begin{array}{c} 3^+ \\ | \\ -K+ \\ | \\ -L+ \\ / \\ +1 \end{array} \quad \begin{array}{c} 4^- \\ \diagup \\ -K+ \\ | \\ -L+ \\ / \\ +1 \end{array} = \begin{array}{c} +2 \\ \diagdown \\ k^- \\ / \\ +\hat{1} \end{array} \quad \frac{1}{P_{12}^2} \quad \begin{array}{c} 3^+ \\ | \\ +k \\ / \\ +\hat{5} \end{array} \quad \begin{array}{c} 4^- \\ \diagup \\ +k \\ / \\ +\hat{5} \end{array} \quad (A)$$

$$+ \begin{array}{c} 2^+ \\ \diagup \\ \text{---} \end{array} \begin{array}{c} 3^+ \\ | \\ \text{---} \end{array} \begin{array}{c} 1^- \\ \diagdown \\ \text{---} \end{array} \frac{1}{p^2} \begin{array}{c} 1^+ \\ \text{---} \\ \diagdown \end{array} \begin{array}{c} 4^- \\ \diagup \\ \text{---} \end{array} \begin{array}{c} 5^- \\ \diagdown \\ \text{---} \end{array} \quad (B)$$

$$\begin{array}{c} +2 \\ \diagup \\ \text{---} \\ \diagdown \\ +1 \end{array} \begin{array}{c} - \\ + \\ - \\ + \end{array} \begin{array}{c} 3^+ \\ \diagup \\ \text{---} \\ \diagdown \\ 4^- \end{array} = \begin{array}{c} +2 \\ \diagup \\ \text{---} \\ \diagdown \\ +1 \end{array} \begin{array}{c} - \\ \text{---} \end{array} \cdot \frac{1}{P_{12}^2} \begin{array}{c} + \\ - \\ + \end{array} \begin{array}{c} 3^+ \\ \diagup \\ \text{---} \\ \diagdown \\ 4^- \end{array} \quad (C)$$

$$\begin{array}{c}
 \begin{array}{c} +3 \\ \diagup \\ \text{---} \end{array} \begin{array}{c} - \\ \text{---} \end{array} \begin{array}{c} + \\ \text{---} \end{array} \begin{array}{c} - \\ \text{---} \end{array} \begin{array}{c} + \\ \text{---} \end{array} \begin{array}{c} \diagdown \\ 4^- \end{array} \\
 \begin{array}{c} +2 \\ \diagdown \\ \text{---} \end{array} \text{---} \begin{array}{c} | \\ 1^+ \end{array} \text{---} \begin{array}{c} | \\ 5^- \end{array} \\
 \end{array} = \begin{array}{c} \begin{array}{c} +3 \\ \diagup \\ \text{---} \end{array} \begin{array}{c} - \\ \text{---} \end{array} \begin{array}{c} + \\ \text{---} \end{array} \begin{array}{c} - \\ \text{---} \end{array} \begin{array}{c} \diagdown \\ 4^- \end{array} \\
 \begin{array}{c} +2 \\ \diagdown \\ \text{---} \end{array} \text{---} \begin{array}{c} | \\ 1^+ \end{array} \text{---} \frac{1}{p_{45}^2} \text{---} \begin{array}{c} + \\ \text{---} \end{array} \begin{array}{c} \diagdown \\ 5^- \end{array} \\
 \end{array} \quad (D)$$

Figure 1: Factorization of the 5-point function

Comments:

- Each time there is only one internal line between the shifted/external gluons, the factorization is trivial.

In particular, C and D are trivial.

- When there is more than one internal line that can be set on-shell, the proof of factorization rests on a simple algebraic identity involving the propagators.

In particular, the sum A+B equals

$$\frac{1}{P_{12}^2} \frac{1}{P_{45}^2} = \frac{1}{P_{12}^2} \frac{1}{P_{4\hat{5}}^2} + \frac{1}{P_{\hat{1}2}^2} \frac{1}{P_{45}^2},$$

where we defined the shifted reference gluon external momenta

$$\begin{aligned} P_{\hat{1}} &= P_1 + \hat{z}\eta, & P_{\hat{5}} &= P_5 - \hat{z}\eta \\ P_{\hat{\bar{1}}} &= P_1 + \hat{\bar{z}}\eta, & P_{\hat{\bar{5}}} &= P_5 - \hat{\bar{z}}\eta. \end{aligned}$$

$\hat{z}, \hat{\bar{z}}$ are such that we put the internal lines K, L , respectively, on-shell

$$\hat{z} = -\frac{P_{12}^2}{2\eta \cdot P_{12}} = -\frac{\langle 12 \rangle}{\langle 52 \rangle}, \quad \hat{\bar{z}} = \frac{P_{45}^2}{2\eta \cdot P_{45}} = \frac{\langle 45 \rangle}{\langle 15 \rangle}.$$

Massaging "A+B":

$$\frac{1}{P_{12}^2} \frac{1}{P_{45}^2} = \frac{1}{P_{12}^2} \frac{1}{P_{4\bar{5}}^2} + \frac{1}{P_{\hat{1}2}^2} \frac{1}{P_{45}^2}$$

🔴 Recall $\eta = |+\rangle[-] = |5\rangle[1]$.

🔴 Use that

$$P_{12}^2 = -2\hat{z}\eta \cdot P_{12}, \quad P_{45}^2 = 2\hat{z}\eta \cdot P_{45}$$

$$P_{\hat{1}2}^2 = 2(\hat{z} - \hat{z})\eta \cdot P_{12}, \quad P_{4\bar{5}}^2 = 2(\hat{z} - \hat{z})\eta \cdot P_{45}$$

Massaging "A+B":

$$\frac{1}{P_{12}^2} \frac{1}{P_{45}^2} = \frac{1}{P_{12}^2} \frac{1}{P_{4\hat{5}}^2} + \frac{1}{P_{\hat{1}2}^2} \frac{1}{P_{45}^2}$$

Recall $\eta = |+\rangle[-] = |5\rangle[1]$.

Use that

$$P_{12}^2 = -2\hat{z}\eta \cdot P_{12}, \quad P_{45}^2 = 2\hat{\hat{z}}\eta \cdot P_{45}$$

$$P_{\hat{1}2}^2 = 2(\hat{\hat{z}} - \hat{z})\eta \cdot P_{12}, \quad P_{4\hat{5}}^2 = 2(\hat{\hat{z}} - \hat{z})\eta \cdot P_{45}$$

then "A+B" becomes a trivial algebraic identity

$$\frac{1}{\hat{z}\hat{\hat{z}}} = \frac{1}{(\hat{\hat{z}} - \hat{z})\hat{z}} - \frac{1}{(\hat{\hat{z}} - \hat{z})\hat{\hat{z}}}.$$

This completes the proof of the BCFW recursion relation from Feynman diagrams for the 5-point function.

The largest time equation

Consider the scalar propagator:

$$\Delta(x-y) = \frac{1}{i} \int \frac{d^4 L}{(2\pi)^4} \frac{1}{L^2 - i\epsilon} e^{iL \cdot (x-y)}.$$

We begin by explicitly construct a representation of the Feynman propagator, wherein a light-like four-vector is introduced as a parameter.

Massaging "A+B":

$$\frac{1}{P_{12}^2} \frac{1}{P_{45}^2} = \frac{1}{P_{12}^2} \frac{1}{P_{4\hat{5}}^2} + \frac{1}{P_{\hat{1}2}^2} \frac{1}{P_{45}^2}$$

• Recall $\eta = |+\rangle[-] = |5\rangle[1]$.

• Use that

$$P_{12}^2 = -2\hat{z}\eta \cdot P_{12}, \quad P_{45}^2 = 2\hat{\hat{z}}\eta \cdot P_{45}$$

$$P_{\hat{1}2}^2 = 2(\hat{\hat{z}} - \hat{z})\eta \cdot P_{12}, \quad P_{4\hat{5}}^2 = 2(\hat{\hat{z}} - \hat{z})\eta \cdot P_{45}$$

• then "A+B" becomes a trivial algebraic identity

$$\frac{1}{\hat{z}\hat{\hat{z}}} = \frac{1}{(\hat{\hat{z}} - \hat{z})\hat{z}} - \frac{1}{(\hat{\hat{z}} - \hat{z})\hat{\hat{z}}}.$$

This completes the proof of the BCFW recursion relation from Feynman diagrams for the 5-point function.

The largest time equation

Consider the scalar propagator:

$$\Delta(x-y) = \frac{1}{i} \int \frac{d^4 L}{(2\pi)^4} \frac{1}{L^2 - i\epsilon} e^{iL \cdot (x-y)}.$$

We begin by explicitly construct a representation of the Feynman propagator, wherein a light-like four-vector is introduced as a parameter.

The largest time equation

Consider the scalar propagator:

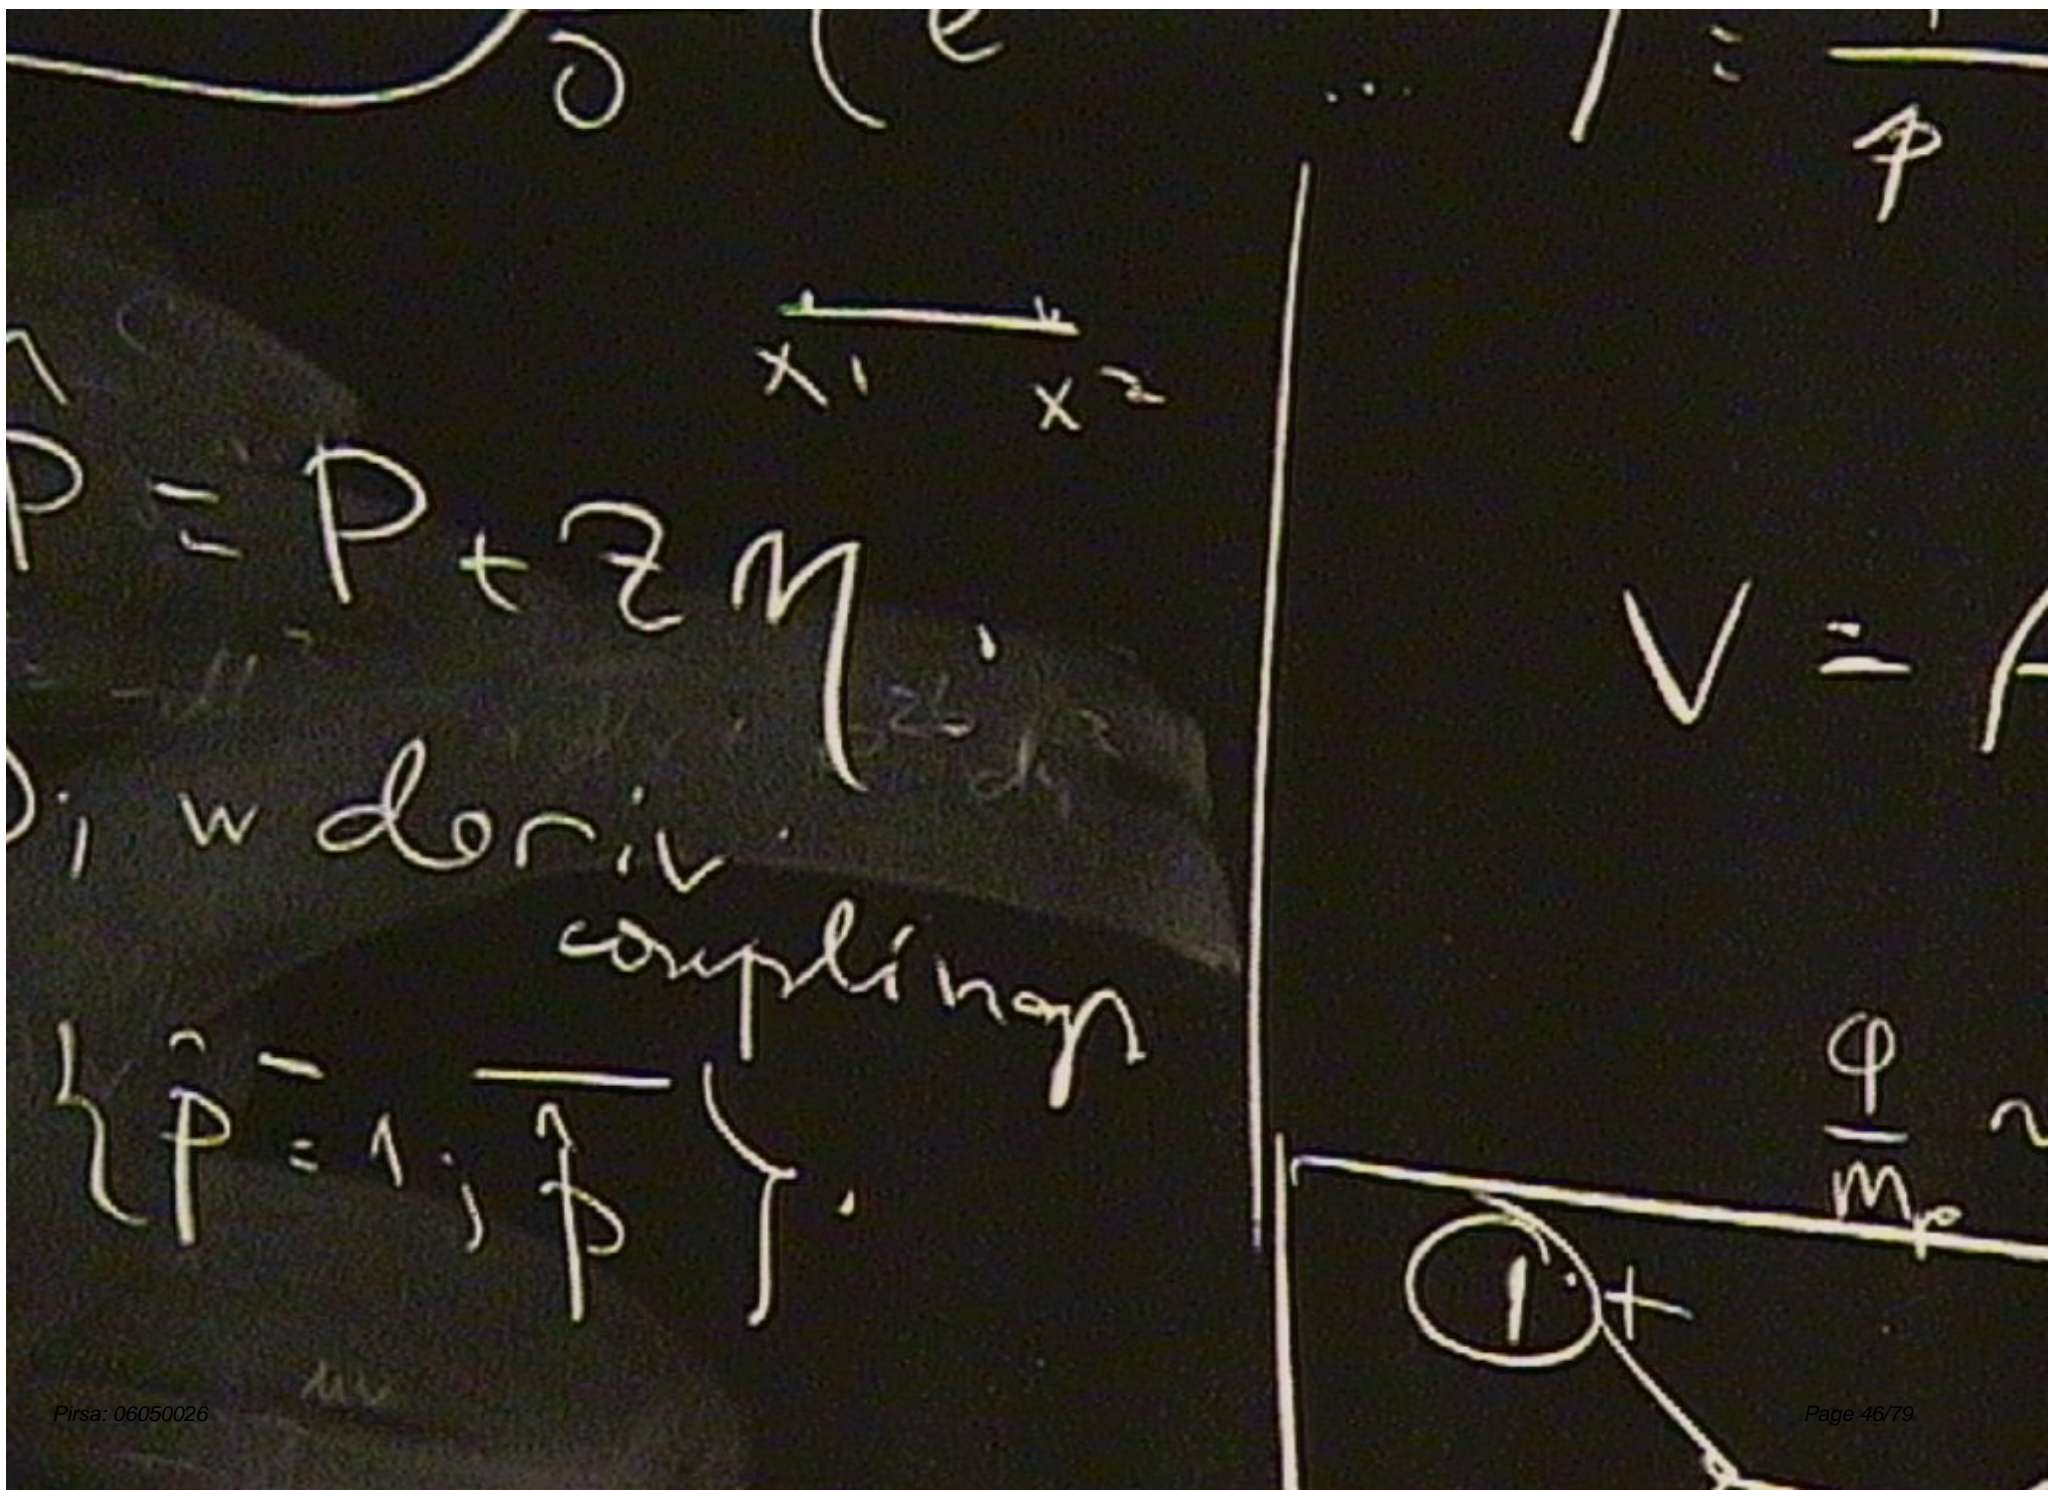

$$\Delta(x-y) = \frac{1}{i} \int \frac{d^4 L}{(2\pi)^4} \frac{1}{L^2 - i\epsilon} e^{iL \cdot (x-y)}.$$

We begin by explicitly construct a representation of the Feynman propagator, wherein a light-like four-vector is introduced as a parameter.

$$\begin{aligned} \Delta(x-y) &= \frac{1}{i} \int \frac{d^4 p}{(2\pi)^4} \int \frac{dz}{z - i\epsilon} \theta(p^+) \delta(p^2) e^{i(p-z\eta) \cdot (x-y)} \\ &\quad - \frac{1}{i} \int \frac{d^4 p}{(2\pi)^4} \int \frac{dz}{z + i\epsilon} \theta(-p^+) \delta(p^2) e^{i(p-z\eta) \cdot (x-y)}, \end{aligned}$$

with η an arbitrary null vector. Appropriating some common notations to the light-cone frame context, we can rewrite the position space propagator

$$\Delta(x-y) = \theta((x-y)^+) \Delta^+(x-y) + \theta(-(x-y)^+) \Delta^-(x-y).$$

The largest time equation

Consider the scalar propagator:

$$\Delta(x-y) = \frac{1}{i} \int \frac{d^4 L}{(2\pi)^4} \frac{1}{L^2 - i\epsilon} e^{iL \cdot (x-y)}.$$

We begin by explicitly construct a representation of the Feynman propagator, wherein a light-like four-vector is introduced as a parameter.

$$\begin{aligned} \Delta(x-y) &= \frac{1}{i} \int \frac{d^4 p}{(2\pi)^4} \int \frac{dz}{z - i\epsilon} \theta(p^+) \delta(p^2) e^{i(p-z\eta) \cdot (x-y)} \\ &\quad - \frac{1}{i} \int \frac{d^4 p}{(2\pi)^4} \int \frac{dz}{z + i\epsilon} \theta(-p^+) \delta(p^2) e^{i(p-z\eta) \cdot (x-y)}, \end{aligned}$$

with η an arbitrary null vector. Appropriating some common notations to the light-cone frame context, we can rewrite the position space propagator

$$\Delta(x-y) = \theta((x-y)^+) \Delta^+(x-y) + \theta(-(x-y)^+) \Delta^-(x-y).$$

The algebraic identity involving propagators, which sits at the core of our proof of factorization, is a consequence of the largest time equation. Following Veltman '63, we begin with the following set of rules:

- for any Feynman diagram, construct all copies s.t. the vertices can be circled or un-circled;
- any circled vertex brings i , and each un-circled vertex a factor $(-i)$
- the propagator between two uncircled vertices is $\Delta(x - y)$, and the one between circled vertices is $\Delta^*(x - y)$
- the propagator between circled and un-circled vertices is $\Delta^+(x - y)$ and between un-circled and circled is $\Delta^-(x - y)$

$$F(x_i) + F^*(x_i) + \mathbf{F}(x_i) = 0$$

$p^-)$

$$= \frac{1}{p}$$

$$V = A + B e^{-4/m_p} + e^{24/m_p}$$

The algebraic identity involving propagators, which sits at the core of our proof of factorization, is a consequence of the largest time equation. Following Veltman '63, we begin with the following set of rules:

- for any Feynman diagram, construct all copies s.t. the vertices can be circled or un-circled;
- any circled vertex brings i , and each un-circled vertex a factor $(-i)$
- the propagator between two uncircled vertices is $\Delta(x - y)$, and the one between circled vertices is $\Delta^*(x - y)$
- the propagator between circled and un-circled vertices is $\Delta^+(x - y)$ and between un-circled and circled is $\Delta^-(x - y)$

$$F(x_i) + F^*(x_i) + \mathbf{F}(x_i) = 0$$

$$A + B e^{-\frac{4}{m} p} + e^{-\frac{2}{m} p}$$

$$\delta(x-y) = \delta(y-x)$$

$$\sim \left(\frac{1}{p} \right) \gg 1 = \int \delta(p^2) \dots$$

②

Another way to phrase the largest time equation is to select x_k and x_l . Assume $x_k^+ < x_l^+$. Then, one has

$$\theta((x_l - x_k)^+)(F(x_i) + \mathbf{F}(k, x_i)) = 0,$$

where $\mathbf{F}(k, x_i)$ is the sum of all diagrams with k uncircled, but at least one other vertex circled. Similarly, one has

$$\theta((x_k - x_l)^+)(F(x_i) + \mathbf{F}(l, x_i)) = 0,$$

By adding these two equations one finds

$$F(x_i) = -\mathbf{F}(k, l, x_i) - \theta((x_l - x_k)^+)\mathbf{F}(k, l, x_i) - \theta((x_k - x_l)^+)\mathbf{F}(k, l, x_i),$$

where $\mathbf{F}(k, l, x_i)$ is the sum of all diagrams with neither k, l circled, but at least one other vertex circled, $\mathbf{F}(k, l, x_i)$ is the sum of all amplitudes with k uncircled, but l circled.

The shift of two external momenta by $\pm z\eta$ in the on-shell recursion relations is nothing but the result of the implementation of the step functions that appear in the largest time equation.

Another way to phrase the largest time equation is to select x_k and x_l . Assume $x_k^+ < x_l^+$. Then, one has

$$\theta((x_l - x_k)^+)(F(x_i) + \mathbf{F}(k, x_i)) = 0,$$

where $\mathbf{F}(k, x_i)$ is the sum of all diagrams with k uncircled, but at least one other vertex circled. Similarly, one has

$$\theta((x_k - x_l)^+)(F(x_i) + \mathbf{F}(l, x_i)) = 0,$$

By adding these two equations one finds

$$F(x_i) = -\mathbf{F}(k, l, x_i) - \theta((x_l - x_k)^+)\mathbf{F}(k, \mathbf{l}, x_i) - \theta((x_k - x_l)^+)\mathbf{F}(\mathbf{k}, l, x_i),$$

where $\mathbf{F}(k, l, x_i)$ is the sum of all diagrams with neither k, l circled, but at least one other vertex circled, $\mathbf{F}(k, \mathbf{l}, x_i)$ is the sum of all amplitudes with k uncircled, but l circled.

The shift of two external momenta by $\pm z\eta$ in the on-shell recursion relations is nothing but the result of the implementation of the step functions that appear in the largest time equation.

Consider the propagator identity we found for the 5-point function $(+ + + - -)$. Reinstating the usual $i\epsilon$ prescription in the momentum space propagators, the left-hand-side of the identity becomes:

$$\frac{\delta(P_1 + \dots + P_5)}{P_{12}^2} \frac{1}{P_{45}^2} = i^2 \int dx_1 dx_2 dx_3 \Delta(x_1 - x_2) \Delta(x_2 - x_3) e^{i(P_1 + P_2)x_1 + iP_3x_2 + i(P_4 + P_5)x_3}.$$

The shifted propagators which appear on the left-hand-side of the identity can be cast into

$$\frac{\delta(P_1 + \dots + P_5)}{P_{12}^2} \frac{1}{P_{45}^2} = i^2 \int dx_1 dx_2 dx_3 e^{i(P_1 + P_2)x_1 + iP_3x_2 + i(P_4 + P_5)x_3} \left(\theta((x_1 - x_3)^+) \Delta^+(x_1 - x_2) + \theta((x_3 - x_1)^+) \Delta^-(x_1 - x_2) \right) \Delta(x_2 - x_3)$$

$\frac{1}{\phi}$

$$= A + B e^{-\frac{4}{m_r}} + \dots$$

$\frac{1}{\phi}$

$$A + B \rightarrow \phi / m_p + \phi / m_p$$

Consider the propagator identity we found for the 5-point function $(+++--)$. Reinstating the usual $i\epsilon$ prescription in the momentum space propagators, the left-hand-side of the identity becomes:

$$\frac{\delta(P_1 + \dots + P_5)}{P_{12}^2} \frac{1}{P_{45}^2} = i^2 \int dx_1 dx_2 dx_3 \Delta(x_1 - x_2) \Delta(x_2 - x_3) e^{i(P_1 + P_2)x_1 + iP_3x_2 + i(P_4 + P_5)x_3}.$$

The shifted propagators which appear on the left-hand-side of the identity can be cast into

$$\frac{\delta(P_1 + \dots + P_5)}{P_{12}^2} \frac{1}{P_{45}^2} = i^2 \int dx_1 dx_2 dx_3 e^{i(P_1 + P_2)x_1 + iP_3x_2 + i(P_4 + P_5)x_3} \left(\theta((x_1 - x_3)^+) \Delta^+(x_1 - x_2) + \theta((x_3 - x_1)^+) \Delta^-(x_1 - x_2) \right) \Delta(x_2 - x_3)$$

$$+ \begin{array}{c} 2 \\ + \end{array} \begin{array}{c} 3^+ \\ | \\ + \end{array} \begin{array}{c} 4^- \\ \\ \end{array} \theta(x_3^+ - x_l^+)$$

+ etc...

After a similar manipulation of the second term on the rhs, the identity becomes

$$\begin{aligned} & \int dx_1 dx_2 dx_3 e^{i(P_1+P_2)x_1+iP_3x_2+i(P_4+P_5)x_3} \left[\Delta(x_1-x_2)\Delta(x_2-x_3) \right. \\ & - \left(\theta((x_1-x_3)^+) \Delta^+(x_1-x_2) + \theta((x_3-x_1)^+) \Delta^-(x_1-x_2) \right) \Delta(x_2-x_3) \\ & \left. - \left(\theta((x_1-x_3)^+) \Delta^+(x_2-x_3) + \theta((x_3-x_1)^+) \Delta^-(x_2-x_3) \right) \Delta(x_1-x_2) \right] = 0. \end{aligned}$$

There is one more step that is needed in order to show the relationship with the largest time equation with x_1, x_3 the two vertices that are singled out

$$\begin{aligned} \Delta(x_1-x_2)\Delta(x_2-x_3) &= \Delta^-(x_1-x_2)\Delta^+(x_2-x_3) \\ &+ \theta((x_1-x_3)^+) \left(\Delta^+(x_1-x_2)\Delta(x_2-x_3) - \Delta^*(x_1-x_2)\Delta^+(x_2-x_3) \right) \\ &+ \theta((x_3-x_1)^+) \left(\Delta(x_1-x_2)\Delta^-(x_2-x_3) - \Delta^-(x_1-x_2)\Delta^*(x_2-x_3) \right) \end{aligned}$$

The Fourier-transform of our identity equals the largest time equation up to the following extra

terms: $\theta((x_1-x_3)^+) \Delta^+(x_1-x_2)\Delta^+(x_2-x_3), \theta((x_3-x_1)^+) \Delta^-(x_1-x_2)\Delta^-(x_2-x_3).$

These terms in fact are zero as the product of the three distributions has zero support. The easiest to see this is to evaluate the Fourier transform

$$\int dx_1 dx_2 dx_3 e^{i(P_1+P_2)x_1+iP_3x_2+i(P_4+P_5)x_3} \theta((x_1-x_3)^+) \Delta^+(x_1-x_2) \Delta^+(x_2-x_3)$$

by rewriting the step function as a z -integral, followed by the integration over x_1, x_2, x_3 , to arrive at

$$\delta(P_1 + \dots P_5) \int dz \frac{1}{z - i\epsilon} \delta^+((P_1 + P_2 + z\eta)^2) \delta^+((P_4 + P_5 - z\eta)^2).$$

It is clear that no z can satisfy the simultaneously the two delta-function constraints.

$$\begin{array}{c}

 \begin{array}{c} +1 \\ / \end{array} \quad \begin{array}{c} 5^- \\ \backslash \end{array} \end{array} \begin{array}{c} \circ \\ + \end{array} \theta(x_3^+ - x_l^+) \\
 + \begin{array}{c} \begin{array}{c} 2 \\ + \end{array} \begin{array}{c} 3^+ \\ | \\ - \end{array} \begin{array}{c} 4^- \\ \\ \end{array} \\
 \begin{array}{c} +1 \\ / \end{array} \quad \begin{array}{c} 5^- \\ \backslash \end{array} \end{array} \begin{array}{c} \circ \\ + \end{array} \begin{array}{c} \begin{array}{c} 2 \\ + \end{array} \begin{array}{c} 3^+ \\ | \\ - \end{array} \begin{array}{c} 4^- \\ \\ \end{array} \\
 \begin{array}{c} +1 \\ / \end{array} \quad \begin{array}{c} 5^- \\ \backslash \end{array} \end{array} \begin{array}{c} \circ \\ + \end{array} \theta(x_3^+ - x_l^+) \\
 + \text{etc...}$$

After a similar manipulation of the second term on the rhs, the identity becomes

$$\begin{aligned} & \int dx_1 dx_2 dx_3 e^{i(P_1+P_2)x_1+iP_3x_2+i(P_4+P_5)x_3} \left[\Delta(x_1-x_2)\Delta(x_2-x_3) \right. \\ & - \left(\theta((x_1-x_3)^+) \Delta^+(x_1-x_2) + \theta((x_3-x_1)^+) \Delta^-(x_1-x_2) \right) \Delta(x_2-x_3) \\ & - \left. \left(\theta((x_1-x_3)^+) \Delta^+(x_2-x_3) + \theta((x_3-x_1)^+) \Delta^-(x_2-x_3) \right) \Delta(x_1-x_2) \right] = 0. \end{aligned}$$

There is one more step that is needed in order to show the relationship with the largest time equation with x_1, x_3 the two vertices that are singled out

$$\begin{aligned} \Delta(x_1-x_2)\Delta(x_2-x_3) &= \Delta^-(x_1-x_2)\Delta^+(x_2-x_3) \\ &+ \theta((x_1-x_3)^+) \left(\Delta^+(x_1-x_2)\Delta(x_2-x_3) - \Delta^*(x_1-x_2)\Delta^+(x_2-x_3) \right) \\ &+ \theta((x_3-x_1)^+) \left(\Delta(x_1-x_2)\Delta^-(x_2-x_3) - \Delta^-(x_1-x_2)\Delta^*(x_2-x_3) \right) \end{aligned}$$

The Fourier-transform of our identity equals the largest time equation up to the following extra

terms: $\theta((x_1-x_3)^+) \Delta^+(x_1-x_2)\Delta^+(x_2-x_3), \theta((x_3-x_1)^+) \Delta^-(x_1-x_2)\Delta^-(x_2-x_3).$

$$\frac{1}{\phi}$$

$$= A + B e^{-\phi/mr} +$$

$$\Delta(\dots) = \Delta(\dots)$$

$$\begin{aligned} & \frac{1}{\phi_{12}^2} \frac{1}{\phi_{45}^2} \\ & + \frac{1}{\phi_{12}^2} \frac{1}{\phi_{45}^2} \\ & + \frac{1}{\phi_{12}^2} \frac{1}{\phi_{45}^2} \end{aligned}$$

After a similar manipulation of the second term on the rhs, the identity becomes

$$\begin{aligned} & \int dx_1 dx_2 dx_3 e^{i(P_1+P_2)x_1+iP_3x_2+i(P_4+P_5)x_3} \left[\Delta(x_1-x_2)\Delta(x_2-x_3) \right. \\ & - \left(\theta((x_1-x_3)^+) \Delta^+(x_1-x_2) + \theta((x_3-x_1)^+) \Delta^-(x_1-x_2) \right) \Delta(x_2-x_3) \\ & - \left. \left(\theta((x_1-x_3)^+) \Delta^+(x_2-x_3) + \theta((x_3-x_1)^+) \Delta^-(x_2-x_3) \right) \Delta(x_1-x_2) \right] = 0. \end{aligned}$$

There is one more step that is needed in order to show the relationship with the largest time equation with x_1, x_3 the two vertices that are singled out

$$\begin{aligned} \Delta(x_1-x_2)\Delta(x_2-x_3) &= \Delta^-(x_1-x_2)\Delta^+(x_2-x_3) \\ &+ \theta((x_1-x_3)^+) \left(\Delta^+(x_1-x_2)\Delta(x_2-x_3) - \Delta^*(x_1-x_2)\Delta^+(x_2-x_3) \right) \\ &+ \theta((x_3-x_1)^+) \left(\Delta(x_1-x_2)\Delta^-(x_2-x_3) - \Delta^-(x_1-x_2)\Delta^*(x_2-x_3) \right) \end{aligned}$$

The Fourier-transform of our identity equals the largest time equation up to the following extra

terms: $\theta((x_1-x_3)^+) \Delta^+(x_1-x_2)\Delta^+(x_2-x_3), \theta((x_3-x_1)^+) \Delta^-(x_1-x_2)\Delta^-(x_2-x_3).$

These terms in fact are zero as the product of the three distributions has zero support. The easiest to see this is to evaluate the Fourier transform

$$\int dx_1 dx_2 dx_3 e^{i(P_1+P_2)x_1+iP_3x_2+i(P_4+P_5)x_3} \theta((x_1-x_3)^+) \Delta^+(x_1-x_2) \Delta^+(x_2-x_3)$$

by rewriting the step function as a z -integral, followed by the integration over x_1, x_2, x_3 , to arrive at

$$\delta(P_1 + \dots P_5) \int dz \frac{1}{z - i\epsilon} \delta^+((P_1 + P_2 + z\eta)^2) \delta^+((P_4 + P_5 - z\eta)^2).$$

It is clear that no z can satisfy the simultaneously the two delta-function constraints.

These terms in fact are zero as the product of the three distributions has zero support. The easiest to see this is to evaluate the Fourier transform

$$\int dx_1 dx_2 dx_3 e^{i(P_1+P_2)x_1 + iP_3x_2 + i(P_4+P_5)x_3} \theta((x_1 - x_3)^+) \Delta^+(x_1 - x_2) \Delta^+(x_2 - x_3)$$

by rewriting the step function as a z -integral, followed by the integration over x_1, x_2, x_3 , to arrive at

$$\delta(P_1 + \dots P_5) \int dz \frac{1}{z - i\epsilon} \delta^+((P_1 + P_2 + z\eta)^2) \delta^+((P_4 + P_5 - z\eta)^2).$$

It is clear that no z can satisfy the simultaneously the two delta-function constraints.

We have shown that the algebraic identity which was found by reassembling the Feynman diagrams into the BCFW recursion relations arises from the more fundamental largest time equation.

Massaging "A+B":

$$\frac{1}{P_{12}^2} \frac{1}{P_{45}^2} = \frac{1}{P_{12}^2} \frac{1}{P_{4\bar{5}}^2} + \frac{1}{P_{\hat{1}2}^2} \frac{1}{P_{45}^2}$$

• Recall $\eta = |+\rangle[-] = |5\rangle[1]$.

• Use that

$$P_{12}^2 = -2\hat{z}\eta \cdot P_{12}, \quad P_{45}^2 = 2\hat{z}\eta \cdot P_{45}$$

$$P_{\hat{1}2}^2 = 2(\hat{z} - \hat{z})\eta \cdot P_{12}, \quad P_{4\bar{5}}^2 = 2(\hat{z} - \hat{z})\eta \cdot P_{45}$$

Massaging "A+B":

$$\frac{1}{P_{12}^2} \frac{1}{P_{45}^2} = \frac{1}{P_{12}^2} \frac{1}{P_{4\hat{5}}^2} + \frac{1}{P_{\hat{1}2}^2} \frac{1}{P_{45}^2}$$

• Recall $\eta = |+\rangle[-] = |5\rangle[1]$.

• Use that

$$P_{12}^2 = -2\hat{z}\eta \cdot P_{12}, \quad P_{45}^2 = 2\hat{\hat{z}}\eta \cdot P_{45}$$

$$P_{\hat{1}2}^2 = 2(\hat{\hat{z}} - \hat{z})\eta \cdot P_{12}, \quad P_{4\hat{5}}^2 = 2(\hat{\hat{z}} - \hat{z})\eta \cdot P_{45}$$

• then "A+B" becomes a trivial algebraic identity

$$\frac{1}{\hat{z}\hat{\hat{z}}} = \frac{1}{(\hat{\hat{z}} - \hat{z})\hat{z}} - \frac{1}{(\hat{\hat{z}} - \hat{z})\hat{\hat{z}}}.$$

This completes the proof of the BCFW recursion relation from Feynman diagrams for the 5-point function.

Consider the propagator identity we found for the 5-point function $(+++--)$. Reinstating the usual $i\epsilon$ prescription in the momentum space propagators, the left-hand-side of the identity becomes:

$$\frac{\delta(P_1 + \dots + P_5)}{P_{12}^2} \frac{1}{P_{45}^2} = i^2 \int dx_1 dx_2 dx_3 \Delta(x_1 - x_2) \Delta(x_2 - x_3) e^{i(P_1 + P_2)x_1 + iP_3x_2 + i(P_4 + P_5)x_3}.$$

The shifted propagators which appear on the left-hand-side of the identity can be cast into

$$\frac{\delta(P_1 + \dots + P_5)}{P_{12}^2} \frac{1}{P_{45}^2} = i^2 \int dx_1 dx_2 dx_3 e^{i(P_1 + P_2)x_1 + iP_3x_2 + i(P_4 + P_5)x_3} \left(\theta((x_1 - x_3)^+) \Delta^+(x_1 - x_2) + \theta((x_3 - x_1)^+) \Delta^-(x_1 - x_2) \right) \Delta(x_2 - x_3)$$

These terms in fact are zero as the product of the three distributions has zero support. The easiest to see this is to evaluate the Fourier transform

$$\int dx_1 dx_2 dx_3 e^{i(P_1+P_2)x_1 + iP_3x_2 + i(P_4+P_5)x_3} \theta((x_1 - x_3)^+) \Delta^+(x_1 - x_2) \Delta^+(x_2 - x_3)$$

by rewriting the step function as a z -integral, followed by the integration over x_1, x_2, x_3 , to arrive at

$$\delta(P_1 + \dots P_5) \int dz \frac{1}{z - i\epsilon} \delta^+((P_1 + P_2 + z\eta)^2) \delta^+((P_4 + P_5 - z\eta)^2).$$

It is clear that no z can satisfy the simultaneously the two delta-function constraints.

We have shown that the algebraic identity which was found by reassembling the Feynman diagrams into the BCFW recursion relations arises from the more fundamental largest time equation.

Comments: For the largest time equation η is real. For its Fourier-transform version into momentum space, appropriate for a physical process under consideration we keep η as a variable.

We then analytically complexify $\eta \longrightarrow |+\rangle[-|$.

A general proof which can be extended to massless/massive scalar particles coupled to Yang-Mills gauge bosons is based on partial fractioning.

The factorization procedure amounts to splicing the graph into a sum of products of two on-shell graphs with shifted momenta $\{p_a - z_i \eta, \dots, \bar{q}_i\}$ and $\{-\bar{q}_i, \dots, p_b + z_i \eta\}$, multiplying the propagator $\frac{1}{q_i^2 + m_i^2}$.

Figure 1: Factorization of tree level amplitudes

$$\begin{aligned}
\frac{(-1)^n}{z_1 z_2 \cdots z_{n-1}} &= \frac{1}{z_1(z_1 - z_2)(z_1 - z_3) \cdots (z_1 - z_{n-1})} \\
&+ \frac{1}{(z_2 - z_1)z_2(z_2 - z_3) \cdots (z_2 - z_{n-1})} \\
&\dots\dots\dots \\
&+ \frac{1}{(z_{n-1} - z_1)(z_{n-1} - z_2) \cdots (z_{n-1} - z_{n-2})z_{n-1}}.
\end{aligned}$$

This partial fractioning formula emerges from $\oint \frac{dz}{z(z-z_1)(z-z_2)\cdots(z-z_{n-1})} = 0$.

Adding quarks

Tree level recursion relations with fermions:

Consider the Lagrangian of minimally coupled massive fermions

$$\mathcal{L}_f = \sum_i \bar{\Psi}_i (i\not{\partial} - m_i) \Psi_i,$$

The recursion relations are formulated with the two reference gluons connected by a path which includes a fermionic line are based on the another identity involving momentum space fermion propagators

$$\begin{aligned} & \frac{1}{\not{q}_1 + m_1} \gamma^{\mu_1} \frac{1}{\not{q}_2 + m_2} \gamma^{\mu_2} \dots \gamma^{\mu_{n-2}} \frac{1}{\not{q}_{n-1} + m_{n-1}} \\ = & \frac{m_1 - \not{q}_1 + z_1 \not{n}}{(q_1^2 + m_1^2)} \gamma^{\mu_1} \frac{1}{\not{q}_2 - z_1 \not{n} + m_2} \gamma^{\mu_2} \dots \gamma^{\mu_{n-2}} \frac{1}{\not{q}_{n-1} - z_1 \not{n} + m_{n-1}} \\ + & \frac{1}{\not{q}_1 - z_2 \not{n} + m_1} \gamma^{\mu_1} \frac{m_2 - \not{q}_2 + z_2 \not{n}}{(q_2^2 + m_2^2)} \gamma^{\mu_2} \dots \gamma^{\mu_{n-2}} \frac{1}{\not{q}_{n-1} - z_2 \not{n} + m_{n-1}} \\ + & \dots \dots \dots \\ + & \frac{1}{\not{q}_1 - z_{n-1} \not{n} + m_1} \gamma^{\mu_1} \dots \gamma^{\mu_{n-3}} \frac{1}{\not{q}_{n-2} - z_{n-1} \not{n} + m_{n-2}} \gamma^{\mu_{n-2}} \frac{m_{n-1} - \not{q}_{n-1} + z_{n-1} \not{n}}{(q_{n-1}^2 + m_{n-1}^2)}. \end{aligned}$$

For the proof, first rewrite the fermionic propagators such that all denominators will correspond to scalar propagators. We end up with a set of partial fractioning identities which arise from

$$\int dz \frac{z^m}{(z - z_1)(z - z_2) \dots (z - z_{n-1})} = 0, \text{ for } m < n - 2,$$

where the integral is evaluated over a contour which encircles all the poles.

Conclusions and future directions

- We offered a purely quantum field theoretical proof of the BCFW recursion relations.
- A key ingredient was the use of space-cone gauge.
- The tree level recursion relations emerge at a more fundamental level from the largest time equation.
- Our results lend themselves to natural generalizations to include massive scalars and fermions.
- We are currently investigating the extension of our methods at the loop level.
- A few preliminary results:
 - The dispersive integrals are a hallmark of the largest time equation.
 - We have computed one-loop 3-point functions. For same helicity gluons the amplitude is given by

$$(+++) = (12k) = \frac{\epsilon_1^+ \epsilon_2^+ (p_1^- p_2 - p_2^- p_1)(p_2^- p_k - p_k^- p_2)(p_k^- p_1 - p_1^- p_k)}{p_1 p_2 p_k} \frac{1}{P_1 \cdot P_2}$$

where $P_1^2 = P_2^2 = 0$.
