Abstract:

Spacetime Diagrams Seriously Simplified

Spacetime Diagrams Seriously Simplified

Establish a frame F with horizontal axis x and vertical axis ct so that light rays will appear at $\pm 45^\circ$.

Add a worldline of something moving at $3/5 c$ relative to F . It has a slope of $5/3$ in frame F and will form the t' axis of a frame F' .

Add the x' axis. It will have a slope of $3/5$ in frame F.

Add a gridline for $x = 5$ and 10 light units.

At a speed of $3/5 c$, gamma is $5/4$ which makes marking the t' axis really easy. Wherever the x gridlines meet the t' axis is marks $t' = 4/5t$. Draw t' gridlines for $t' = 4$ and 8 light units.

Draw x and x' grid lines in a similar fashion.

You now have a very powerful tool that allows you to visualize and quantify all sorts of problems in relativity: space contraction, the ‘twin’ paradox, addition of velocities, relativistic Doppler shift etc.

Draw x and x' grid lines in a similar fashion.
