

Title: Introduction to Quantum Foundations

Date: Dec 05, 2007 02:00 PM

URL: <http://pirsa.org/07120045>

Abstract:

Introduction to the Foundations of Quantum Theory

- *Why* the quanta? How do we make sense of the occurrence of quantum phenomena.
 - What are the properties of a phenomena that makes it quantum?
 - What kind of physical process can possibly account for such properties?
 - How does the everyday classical world co-exist with quantum phenomena?
 - ...and could it be different?
- With conceptual *clarity* and *precision* !

Quantum phenomena : interferometry

Quantum phenomena : interferometry

“In any attempt of a pictorial representation of the behaviour of the photon we would, thus, meet with the difficulty: to be obliged to say, on the one hand, that the photon always chooses *one* of the two ways and, on the other hand, that it behaves as if it had passed *both* ways.” Bohr

Quantum phenomena : interferometry

$$\frac{e^{i\frac{\phi_d + \phi_u}{2}}}{\sqrt{2}} \left(e^{-i\frac{\phi_d - \phi_u}{2}} |uu\rangle + e^{i\frac{\phi_d - \phi_u}{2}} |dd\rangle \right)$$

Quantum phenomena : interferometry

Quantum phenomena : interferometry

Superposition is *still* not a statistical ensemble, even when it's an entangled superposition.

The Measurement Problem!

Suppose we prepare a system to be in a particular quantum state: $|u\rangle$

The Measurement Problem!

Suppose we prepare a system to be in a particular quantum state: $|u\rangle$

A measuring device is intended to tell us it is in that state.

The Measurement Problem!

Suppose we prepare a system to be in a particular quantum state: $|u\rangle$

A measuring device is intended to tell us it is in that state.

It starts in some reference state: $|0\rangle$

The Measurement Problem!

Suppose we prepare a system to be in a particular quantum state: $|u\rangle$

A measuring device is intended to tell us it is in that state.

It starts in some reference state: $|0\rangle$

then interacts $|u\rangle|0\rangle \rightarrow |u\rangle|U\rangle$

The Measurement Problem!

Suppose we prepare a system to be in a particular quantum state: $|u\rangle$

A measuring device is intended to tell us it is in that state.

It starts in some reference state: $|0\rangle$

then interacts $|u\rangle|0\rangle \rightarrow |u\rangle|U\rangle$

so that the measuring device state corresponds to something like a big pointer pointing at the letter “U” $|U\rangle$

The Measurement Problem!

Suppose we prepare a system to be in a particular quantum state: $|u\rangle$

A measuring device is intended to tell us it is in that state.

It starts in some reference state: $|0\rangle$

then interacts $|u\rangle|0\rangle \rightarrow |u\rangle|U\rangle$

so that the measuring device state corresponds to something like a big pointer pointing at the letter "U" $|U\rangle$

We also want it to interact with a different state: $|d\rangle$
so that the measuring device output state corresponds to something like a big pointer pointing at the letter "D" $|d\rangle|0\rangle \rightarrow |d\rangle|D\rangle$

The Measurement Problem!

Suppose we prepare a system to be in a particular quantum state: $|u\rangle$

A measuring device is intended to tell us it is in that state.

It starts in some reference state: $|0\rangle$

then interacts $|u\rangle|0\rangle \rightarrow |u\rangle|U\rangle$

so that the measuring device state corresponds to something like a big pointer pointing at the letter “U” $|U\rangle$

We also want it to interact with a different state: $|d\rangle$
so that the measuring device output state corresponds to something like a big pointer pointing at the letter “D” $|d\rangle|0\rangle \rightarrow |d\rangle|D\rangle$

But unitary evolution is linear, so that means:

The Measurement Problem!

Suppose we prepare a system to be in a particular quantum state: $|u\rangle$

A measuring device is intended to tell us it is in that state.

It starts in some reference state: $|0\rangle$

then interacts $|u\rangle|0\rangle \rightarrow |u\rangle|U\rangle$

so that the measuring device state corresponds to something like a big pointer pointing at the letter “U” $|U\rangle$

We also want it to interact with a different state: $|d\rangle$
so that the measuring device output state corresponds to something like a big pointer pointing at the letter “D”

$$|d\rangle|0\rangle \rightarrow |d\rangle|D\rangle$$

But unitary evolution is linear, so that means:

$$\frac{1}{\sqrt{2}}(|u\rangle + |d\rangle)|0\rangle \rightarrow \frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$$

The Measurement Problem!

Suppose we prepare a system to be in a particular quantum state: $|u\rangle$

A measuring device is intended to tell us it is in that state.

It starts in some reference state: $|0\rangle$

then interacts $|u\rangle|0\rangle|E\rangle \rightarrow |u\rangle|U\rangle|E'\rangle$

so that the measuring device state corresponds to something like a big pointer pointing at the letter "U" $|U\rangle$

We also want it to interact with a different state: $|d\rangle$

so that the measuring device output state corresponds to something like a big pointer pointing at the letter "D" $|d\rangle|0\rangle|E\rangle \rightarrow |d\rangle|D\rangle|E''\rangle$

But unitary evolution is linear, so that means:

$$\frac{1}{\sqrt{2}}(|u\rangle + |d\rangle)|0\rangle|E\rangle \rightarrow \frac{1}{\sqrt{2}}(|u\rangle|U\rangle|E'\rangle + |d\rangle|D\rangle|E''\rangle)$$

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

- The superposition really is the actual state of the world. Both outcomes do occur.

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

- The superposition really is the actual state of the world. Both outcomes do occur.

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

- The superposition really is the actual state of the world. Both outcomes do occur.
 - Many Worlds. Our perception splits into two, one perceiving U, one D.

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

- The superposition really is the actual state of the world. Both outcomes do occur.

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

- The superposition really is the actual state of the world. Both outcomes do occur.
 - Many Worlds. Our perception splits into two, one perceiving U, one D.

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

- The superposition really is the actual state of the world. Both outcomes do occur.
 - Many Worlds. Our perception splits into two, one perceiving U, one D.
- The superposition really is the actual state of the world, but there is extra structure as well.

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

- The superposition really is the actual state of the world. Both outcomes do occur.
 - Many Worlds. Our perception splits into two, one perceiving U, one D.
- The superposition really is the actual state of the world, but there is extra structure as well.
 - Hidden Variables. The hidden variables determines whether the U or D outcome has occurred.

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

- The superposition really is the actual state of the world. Both outcomes do occur.
 - Many Worlds. Our perception splits into two, one perceiving U, one D.
- The superposition really is the actual state of the world, but there is extra structure as well.
 - Hidden Variables. The hidden variables determines whether the U or D outcome has occurred.
- Unitary evolution is not right, so that the state of the world is actually U or D.

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

- The superposition really is the actual state of the world. Both outcomes do occur.
 - Many Worlds. Our perception splits into two, one perceiving U, one D.
- The superposition really is the actual state of the world, but there is extra structure as well.
 - Hidden Variables. The hidden variables determines whether the U or D outcome has occurred.
- Unitary evolution is not right, so that the state of the world is actually U or D
 - Objective collapse. In principle leads to different predictions to quantum theory.

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

- The superposition really is the actual state of the world. Both outcomes do occur.
 - Many Worlds. Our perception splits into two, one perceiving U, one D.
- The superposition really is the actual state of the world, but there is extra structure as well.
 - Hidden Variables. The hidden variables determines whether the U or D outcome has occurred.
- Unitary evolution is not right, so that the state of the world is actually U or D
 - Objective collapse. In principle leads to different predictions to quantum theory.
- The wavefunction does *not* represent the state of the world, at all.

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

- The superposition really is the actual state of the world. Both outcomes do occur.
 - Many Worlds. Our perception splits into two, one perceiving U, one D.
- The superposition really is the actual state of the world, but there is extra structure as well.
 - Hidden Variables. The hidden variables determines whether the U or D outcome has occurred.
- Unitary evolution is not right, so that the state of the world is actually U or D
 - Objective collapse. In principle leads to different predictions to quantum theory.
- The wavefunction does *not* represent the state of the world, at all.
 - No microscopic reality at all. Just observers and measuring apparatus, (which is actually pointing to U or D).

The Measurement Problem!

Unitary evolution gives: $\frac{1}{\sqrt{2}}(|u\rangle|U\rangle + |d\rangle|D\rangle)$ (which is not a statistical mix)

What occurs is $|u\rangle|U\rangle$ or $|d\rangle|D\rangle$ (which *is* a statistical mix)

- The superposition really is the actual state of the world. Both outcomes do occur.
 - Many Worlds. Our perception splits into two, one perceiving U, one D.
- The superposition really is the actual state of the world, but there is extra structure as well.
 - Hidden Variables. The hidden variables determines whether the U or D outcome has occurred.
- Unitary evolution is not right, so that the state of the world is actually U or D
 - Objective collapse. In principle leads to different predictions to quantum theory.
- The wavefunction does *not* represent the state of the world, at all.
 - No microscopic reality at all. Just observers and measuring apparatus, (which is actually pointing to U or D).
 - There is a microscopic reality but inaccessible. The microscopic reality determines whether the U or D outcome has occurred.

The non-locality question

1935: Einstein Podolsky and Rosen point out the following:

The non-locality question

1935: Einstein Podolsky and Rosen point out the following:

The non-locality question

1935: Einstein Podolsky and Rosen point out the following:

The non-locality question

1935: Einstein Podolsky and Rosen point out the following:

If I measure the left location (u or d) of the left hand particle, it is always correlated to the location (d or u) of the right hand particle.

If I find the left hand particle in the u channel, the right hand particle is **determinately** in the d channel.

The non-locality question

1935: Einstein Podolsky and Rosen point out the following:

If I measure the left location (u or d) of the left hand particle, it is always correlated to the location (d or u) of the right hand particle.

If I find the left hand particle in the u channel, the right hand particle is **determinately** in the d channel.

Either:

The right hand particle was **already** determinately to be found in the d channel

The non-locality question

1935: Einstein Podolsky and Rosen point out the following:

If I measure the left location (u or d) of the left hand particle, it is always correlated to the location (d or u) of the right hand particle.

If I find the left hand particle in the u channel, the right hand particle is **determinately** in the d channel.

Either:

The right hand particle was **already** determinately to be found in the d channel

Or:

The act of measuring the left hand particle **makes it** determinate that the right hand particle is to be found in the d channel.

The non-locality question

1935: Einstein Podolsky and Rosen point out the following:

If I measure the left location (u or d) of the left hand particle, it is always correlated to the location (d or u) of the right hand particle.

If I find the left hand particle in the u channel,
the right hand particle is **determinately** in the d channel.

Either:

The right hand particle was **already** determinately to be found in the d channel

Or:

The act of measuring the left hand particle **makes it** determinate
that the right hand particle is to be found in the d channel.

As the second possibility is non-local, EPR opt for the first

The non-locality question

1963: Bell points out the following:

The non-locality question

1963: Bell points out the following:

$$\frac{1}{\sqrt{2}}(|u d\rangle + |d u\rangle)$$

Any theory that reproduces the perfect anti-correlations of quantum theory

The non-locality question

1963: Bell points out the following:

$$\frac{1}{\sqrt{2}}(|u d\rangle + |d u\rangle)$$

Any theory that reproduces the perfect anti-correlations of quantum theory
AND
has locally predetermined outcomes

The non-locality question

1963: Bell points out the following:

Any theory that reproduces the perfect anti-correlations of quantum theory
AND
has locally predetermined outcomes
MUST
satisfy an inequality of the form:

The non-locality question

1963: Bell points out the following:

Any theory that reproduces the perfect anti-correlations of quantum theory
AND
has locally predetermined outcomes
MUST
satisfy an inequality of the form:

$$1 + P(b, c) \geq |P(a, b) + P(a, c)|$$

The non-locality question

1963: Bell points out the following:

Any theory that reproduces the perfect anti-correlations of quantum theory
AND
has locally predetermined outcomes
MUST
satisfy an inequality of the form:

$$1 + P(b, c) \geq |P(a, b) + P(a, c)|$$

As quantum theory does not satisfy this equality for the singlet state, Bell concludes from this and EPR that quantum theory is irreducibly, ineliminably, unequivocally *non-local*.

The non-locality question

1969: Clauser, Holt, Horne, Shimony derive a more general inequality, also violated by the singlet state in quantum theory:

$$|E(a, b) + E(a, b')| + |E(a', b) - E(a', b')| \leq 2$$

The non-locality question

1969: Clauser, Holt, Horne, Shimony derive a more general inequality, also violated by the singlet state in quantum theory:

$$|E(a, b) + E(a, b')| + |E(a', b) - E(a', b')| \leq 2$$

Derivations of the CHHS inequality have been made using a variety of separate assumptions:

The non-locality question

1969: Clauser, Holt, Horne, Shimony derive a more general inequality, also violated by the singlet state in quantum theory:

$$|E(a, b) + E(a, b')| + |E(a', b) - E(a', b')| \leq 2$$

Derivations of the CHHS inequality have been made using a variety of separate assumptions:

- Locality and Completeness
- Local Realism
- Local Causality
- Stochastic Einstein Locality
- etc....

The non-locality question

1969: Clauser, Holt, Horne, Shimony derive a more general inequality, also violated by the singlet state in quantum theory:

$$|E(a, b) + E(a, b')| + |E(a', b) - E(a', b')| \leq 2$$

Derivations of the CHSH inequality have been made using a variety of separate assumptions:

- Locality and Completeness
- Local Realism
- Local Causality
- Stochastic Einstein Locality
- etc....

(Of particular note, in 1976 Bell rederived the CHSH inequality without reference to quantum theory, hidden variables or anything like that)

The non-locality question

1969: Clauser, Holt, Horne, Shimony derive a more general inequality, also violated by the singlet state in quantum theory:

$$|E(a, b) + E(a, b')| + |E(a', b) - E(a', b')| \leq 2$$

Derivations of the CHSH inequality have been made using a variety of separate assumptions:

- Locality and Completeness
- Local Realism
- Local Causality
- Stochastic Einstein Locality
- etc....

(Of particular note, in 1976 Bell rederived the CHSH inequality without reference to quantum theory, hidden variables or anything like that)

Quantum mechanics is incompatible with *each* of these conjunctions of assumptions!

The non-locality question

1969: Clauser, Holt, Horne, Shimony derive a more general inequality, also violated by the singlet state in quantum theory:

$$|E(a, b) + E(a, b')| + |E(a', b) - E(a', b')| \leq 2$$

Interpretation,

- Many worlds. Reformulation or Replacement?

Interpretation,

• Many worlds. Reformulation or Replacement?

- Preferred basis. Hilbert spaces do not prefer any particular basis, yet for the Everettian interpretation to succeed, our perceptions must divide in a particular basis. Generally considered to be solved by decoherence.

Interpretation,

• Many worlds. Reformulation or Replacement?

- Preferred basis. Hilbert spaces do not prefer any particular basis, yet for the Everettian interpretation to succeed, our perceptions must divide in a particular basis. Generally considered to be solved by decoherence.
- Probability. How to make sense of normal probabilistic assertions in a universe in which all possible outcomes do actually occur? Recent work has suggested a resolution, but it is still controversial.
- Locality. It has been argued that branching universes do not require any non-locality. This makes reconciliation between quantum theory and general relativity easier to achieve.

• Many worlds. Reformulation or Replacement?

- Preferred basis. Hilbert spaces do not prefer any particular basis, yet for the Everettian interpretation to succeed, our perceptions must divide in a particular basis. Generally considered to be solved by decoherence.
- Probability. How to make sense of normal probabilistic assertions in a universe in which all possible outcomes do actually occur? Recent work has suggested a resolution, but it is still controversial.
- Locality. It has been argued that branching universes do not require any non-locality. This makes reconciliation between quantum theory and general relativity easier to achieve.

• Collapse models

- Non-conservation of energy. Objective collapse models, that produce localised states, generically violate the conservation of energy, *even on average*.
- Relativistic invariance. Explicit collapse models have generally been non-relativistic. Making a relativistically invariant collapse model presents difficulties. Recent progress has been made for non-interacting systems.

Interpretation,

• Many worlds. Reformulation or Replacement?

- Relativistic invariance. Explicit collapse models have generally been non-relativistic. Making a relativistically invariant collapse model presents difficulties. Recent progress has been made for non-interacting systems.
- Empirical predictions. Wavefunction collapse models generically produce situations where different predictions can be made to quantum theory. Experimentally probing these situations are hard, as environmental decoherence must be excluded.

Interpretation, Reformulation or Replacement?

- Hidden Variables

Interpretation, Reformulation or Replacement?

- Hidden Variables
 - Quantum field theory. Although Bohm presented a field ontology for the electromagnetic field in 1952, most work has been on non-relativistic particle theories. Recent work has shown how de Broglie-Bohm hidden variables can be constructed for general interacting field theories.

Interpretation, Reformulation or Replacement?

- Hidden Variables

- Quantum field theory. Although Bohm presented a field ontology for the electromagnetic field in 1952, most work has been on non-relativistic particle theories. Recent work has shown how de Broglie-Bohm hidden variables can be constructed for general interacting field theories.
- Different choices of hidden variable. Particle and field configuration hidden variables present intuitively clear routes to distinct outcomes. Alternative hidden variables - spin, orientation, momentum, matrix valued, grassman number valued - may or may not be feasible.

Interpretation, Reformulation or Replacement?

- Empty waves. In de Broglie-Bohm theories, the portions of the wavefunction that correspond to the outcomes that did not occur, still exist. It can be argued that these outcomes are just as real and that hidden variable theorists are Everettians "in a chronic state of denial".
- Non-equilibrium. Hidden variable theories reproduce quantum mechanics for particular probability distributions over the hidden variable state. This distribution is often referred to as "quantum equilibrium", as it's justifications is similar to thermal equilibrium. The possibility of systems with non-equilibrium distributions would lead to novel experimental results and possibilities.

The possibility of systems with non-equilibrium distributions would lead to novel experimental results and possibilities.

- Ψ epistemic theories

- The wavefunction shares some properties with classical probability distributions. de Broglie-Bohm hidden variable models treat the wavefunction as a real entity. Is it possible to construct models in which the wavefunction is only a probability distribution over a microscopic reality?

Interpretation, Reformulation or Replacement?

- Information as fundamental

Interpretation, Reformulation or Replacement?

- Information as fundamental
 - Can quantum mechanics be better understood as a theory of information? Quantum theory has always seemed to present restrictions upon what can be known about a system. Perhaps quantum theory is simply about information itself, not information about something - the process of acquiring information creating the very information that is acquired. Restrictions on how much information may be known means that new information acquisition must invalidate old information.

 - Hierarchies of theories, possibly containing quantum theory as a limiting case.
 - Experimental tests, including precision testing of macroscopic interference, collapse models, non-equilibrium hidden variables.

Relationships to other fields

- Quantum information
 - Bell tests, entanglement, operational formulations, quantum parallelism, no-cloning, many early researchers and many early results came from the study of quantum foundations.
- Quantum gravity
 - Collapse theories, hidden variables, causal frameworks and other reformulations may help. Any quantum theory of gravity will face the same challenges for understanding observed quantum phenomena.
 - Relativistic causality is empirically falsified. Understanding the causal structure of quantum theory may help.
- Statistical mechanics, cosmology
 - Arrow of time and irreversibility of wavefunction collapse.
