

Title: Blogs, Wikis, MathML: Scientific Communication

Date: Sep 08, 2008 02:00 PM

URL: <http://pirsa.org/08090027>

Abstract: In the 1990s, the eprint arXivs fundamentally reshaped scientific communication in Math and Physics. In this decade, blogs, wikis and other, similar, tools are mediating an equally profound reshaping of scientific communication. I will talk about my own experience, as a blogger, software designer, and physicist, pointing to some of the successes and some of the challenges ahead.

solutions. The result is that the transition temperature is  $T_c = 0.154/L$ . This, of course, holds so long as  $T_c > T_d$ .

$$T_d = \frac{1}{2\pi R}$$

$$T_c = \begin{cases} 0.154/L & T_c > T_d \text{ (or, equivalently, } L/R < 0.97) \\ T_d & \text{otherwise} \end{cases}$$

So the phase diagram found by Aharony et al looks like the [figure](#) at left. All of the phase transitions are first order. In the pale blue region below  $TR = 1/2\pi$ , the theory confines and chiral symmetry is broken. In the pink region, the theory is deconfined but, nonetheless, chiral symmetry is broken. Above all the lines, chiral symmetry is unbroken and the theory is deconfined.

In the classical (smooth) category, there is no ambiguity as to what it means for a function  $u$  to "solve" an equation such as (1); but once one is in a low regularity class (such as the class of finite mass solutions), there are several competing notions of solution, in particular the notions of a *strong solution* and a *weak solution*. To oversimplify a bit, both strong and weak solutions solve (1) in a distributional sense, but strong solutions are also continuous in time (in the space  $L^2(\mathbb{R}^d)$  of functions of finite mass). A canonical example here is given by the [pseudoconformally transformed](#) soliton blowup solution

$$u(t, x) := \frac{1}{|t|^{d/2}} e^{-i/t} e^{i|x|^2/4t} Q(x/t) \quad (2)$$

to (1), where  $Q$  is a solution to the ground state equation  $\Delta Q + |Q|^{4/d}Q = Q$ . This solution is a strong solution on (say) the time interval  $(-\infty, 0)$ , but cannot be continued as a strong solution beyond time zero due to the discontinuity at  $t=0$ . Nevertheless, it can be continued as a weak solution by extending by zero at  $t=0$  and at  $t > 0$  (or alternatively, one could extend for  $t > 0$  using (2); thus there is no uniqueness for the initial value problem in the weak solution class. Note this example also shows that weak solutions need not conserve mass; all the mass in (1) concentrates into the spatial origin as  $t \rightarrow 0$  and disappears in the limit  $t=0$ ).

# Ensuring Well-Formedness

## 1. Forbid markup. Require a pseudo-markup language (e.g. Markdown).

- Disadvantage: limited & users must learn yet another markup syntax.
- Most implementations **fail** to ensure well-formedness. (**Don't** try to produce XML by concatenating strings.)

## 2. Validate user input.

- Disadvantage: puts onus on user to correct problem(s).
- W3C validator not terribly "light-weight".

→ Take the input, parse to a tree (vigourously "correcting" it), then use an XML serializer to output the result.

→ As with 2, unexpected results can be frustrating to users.

→ hard to retrofit existing system (like MT).

# Ensuring Well-Formedness

1. Forbid markup. Require a pseudo-markup language (e.g. Markdown).

- Disadvantage: limited & users must learn yet another markup syntax.
- Most implementations **fail** to ensure well-formedness. (**Don't** try to produce XML by concatenating strings.)

2. Validate user input.

- Disadvantage: puts onus on user to correct problem(s).
- W3C validator not terribly "light-weight".

3. Take the input, parse to a tree (vigourously "correcting" it, à la [HTML5lib](#)). Then use an XML serializer to output the result.

- As with 2, unexpected results can be frustrating to users
- hard to retrofit an existing system (like MT).

# Hook W3C Validator into “Preview” Function

Invisible, but unavoidable.

## The twisted Drinfeld double of a finite group via gerbes and finite groupoids

[Simon Willerton](#)

(Submitted on 14 Mar 2005)

The twisted Drinfeld double (or quasi-quantum double) of a finite group with a 3-cocycle is identified with a certain twisted groupoid algebra. The groupoid is the loop (or inertia) groupoid of the original group and the twisting is shown geometrically to be the loop transgression of the 3-cocycle. The twisted representation theory of finite groupoids is developed and used to derive properties of the Drinfeld double, such as representations being classified by their characters.

This is all motivated by gerbes and 3-dimensional topological quantum field theory. In particular the representation category of the twisted Drinfeld double is viewed as the 'space of sections' associated to a transgressed gerbe over the loop groupoid.

The Baby Version of Freed-H...

For every  $k$ , there is a canonical gerbe on  $G$ , whose Dixmier-Douady class is just that  $\in H^3$ . In fact, from a certain point of view #, the central extension  $\hat{\Omega}_k G$  is that gerbe on  $G$ .

Like a bundle is trivialized by a function. A gerbe may be trivialized by a bundle. Even if the bundle is nontrivial, it can still be “trivialized” in a generalized sense - by a twisted bundle.

Like we have a notion of **K-theory** obtained by taking the group completion of the decategorification of the category of vector bundles on a space, we have a notion of **twisted K-theory** by doing the same with such twisted bundles.

Now, the group  $G$  acts on itself by conjugation. We might hence be interested in the K-theory of the quotient  $G/G$ . This amounts to looking at the (twisted) K-theory of  $G$ -equivariant (twisted) vector bundles on  $G$ .

So that's some ring, let's denote it by

- HEP preprint culture predisposed us to embrace the arXivs.

“Commentary Layer” culture (MR, etc) predisposed them to embrace blogs.

# Community

Thriving ecosystem of blogs in Mathematics.

- From Fields Medalists ([Terry Tao](#), [Alain Connes](#), [Tim Gowers](#))
- To graduate students ([Secret Blogging Seminar](#))
- To our aforementioned [n-Category Café](#)

Arguably, they need a “Commentary Layer” even more than we do.

More importantly, they’re much further along, in recognizing “alternate” forms of scholarly communication (e.g. [Math Reviews](#)).

- HEP preprint culture predisposed us to embrace the arXivs.
- “Commentary Layer” culture (MR, etc) predisposed them to embrace blogs.

# Lessons

---

- **Must** be open-source
- Needs to be easy to set up
  - "one-click install"
- Visitor experience improvements
  - Bring MathML support to WebKit
  - Copy and paste MathML
  - etc...

# Collaboration Tool

Our lives in the past 20 years mostly consist of emailing around TeX files.

My mailbox full of TeX files

Which one contains the (corrected!) calculation of the cross section?

Which one contains that clever argument you had for neglecting interference graphs?

Did you ever sort out that minus sign?

The result of using cutting edge technology

from 25 years ago.

25 years is a long time in internet-years.

So far:

• NetOAV (for file sharing)

• SVN (for version control)

• LaTeX for manuscript creation stage.

For "knowledge accumulation," what we need is an latex-enabled Wiki!

# Collaboration Tool

Remote collaborations mostly consist of emailing around TeX files.

My computer is full of TeX files

Which one contains the (corrected!) calculation of the cross-section?

Which one contains that clever argument you had for neglecting interference graphs?

Did you ever sort out that minus sign?

Result of using cutting edge technology

from 25 years ago.

25 years is a long time in internet-years.

Tools

• WebDAV (for file sharing)

• SVN (for version control)

Useful for manuscript creation stage.

For knowledge accumulation, what we need is an itex-enabled Wiki!

# Collaboration Tool

Remote collaborations mostly consist of emailing around TeX files.

## An email-box full of TeX files

- Which one contains the (corrected!) calculation of the cross section?
- Which one contains that clever argument you had for neglecting interference effects?
- Did you ever sort out that minus sign?
- The result of using cutting edge technology from 25 years ago.
- 25 years is a long time in internet-years.
- LaTeX
  - Git (for file sharing)
  - SVN (for version control)
  - Overleaf (for manuscript creation stage)
- “Knowledge accumulation,” what we need is an itex-enabled Wiki

# Collaboration Tool

Remote collaborations mostly consist of emailing around TeX files.

An email-box full of TeX files

**Which one contains the (corrected!) calculation of the cross-section?**

Which one contains that clever argument you had for neglecting interference graphs?

Did you ever sort out that minus sign?

Result of using cutting edge technology

from 25 years ago.

25 years is a long time in internet-years.

But

WebDAV (for file sharing)

SVN (for version control)

useful for manuscript creation stage.

For "knowledge accumulation," what we need is an latex-enabled Wiki!

Which one contains the (corrected!) calculation of the cross-section?

Which one contains that clever argument you had for neglecting interference graphs?

Did you ever sort out that minus sign?

The result of using cutting edge technology  
from *25 years ago*.

25 years is a long time in internet-years.

Better

WebDAV (for file sharing)

SVN (for version control)

Useful for manuscript creation stage.

For "knowledge accumulation," what we need is an itex-enabled **Wiki!**

# Instiki

---

A Ruby-on-Rails based [Wiki](#).

- Open source.
- Template-based. But easy to replace components which handle user-content with ones which parse their input and then serialize (using REXML) to XML.
- Absolutely *trivial* to set up. Bundled with built-in WebServer.

## [My version](#)

- [Maruku](#) (Markdown implementation)
- [itex2MML](#) (itex support via Ruby bindings)
- [xhtmldiff](#) ("redline docs" of revisions)
- (a heavily-hacked version of) [S5](#) (Presentations)

# Features

- Multiple (password-protected) Wikis under one Instiki instance
- Can publish a read-only version of a password-protected Wiki
- Revision history, with redline "diff"s between successive versions, ability to follow changes
- File uploads
- Full LaTeX and extended Markdown input
- Export to LaTeX
- Presentations

Madge: "You're making In it."

# Features

- Multiple (password-protected) Wikis under one Instiki instance.

Can publish a read-only version of a password-protected Wiki.

Revision history, with redline "diff"s between successive versions, ability to follow changes.

File uploads.

Full-text and extended Markdown input.

$$\int_{-\infty}^{\infty} e^{-ax^2} dx = \sqrt{\frac{\pi}{a}}$$

Export to LaTeX.

Presentations.

Madge: "You're making in it."

# Features

- Multiple (password-protected) Wikis under one Instiki instance.
- Can publish a read-only version of a password-protected Wiki.

Revision history, with redline "diff"s between successive versions, ability to rollback changes.

# Conclusions

---

- New medium for scientific communication.
- New medium enables new forms of communication.
- Different rates of uptake in different subfields, but impact already noticeable.
- It's time to "take back the Web."

# Conclusions

- New tools for scientific communication.
- “New” medium enables new forms of communication.

→ Different rates of uptake in different subfields, but impact already noticeable.

→ It's time to “take back the Web.”

# Conclusions
