

Title: Dark Matter indirect Research with the Pamela Space Experiment

Date: Jan 16, 2009 01:00 PM

URL: <http://pirsa.org/09010020>

Abstract: The PAMELA satellite-borne experiment was launched from the Baikonur cosmodrome on the 15th of June 2006. It has been collecting data since July 2006. The instrument is composed of a silicon-microstrip magnetic spectrometer, a time-of-flight system, a silicon-tungsten electromagnetic calorimeter, an anticoincidence system, a shower tail counter scintillator and a neutron detector. The primary scientific goal is the measurement of the antiproton and positron energy spectrum in order to search for exotic sources, such as dark matter particle annihilations. PAMELA is also searching for primordial antinuclei (anti-helium), and testing cosmic-ray propagation models through precise measurements of the energy spectra of light nuclei and their isotopes. Moreover, PAMELA is investigating phenomena connected with solar and earth physics. The first results obtained in the explored research fields and in particular for antiproton-proton and positron-electron ratios will be presented. (Technical details seminar)

Scientific goals

- **Search for dark matter annihilation**
- **Search for antihelium (primordial antimatter)**
- **Study of cosmic-ray propagation (light nuclei and isotopes)**
- **Study of electron spectrum (local sources?)**
- **Study solar physics and solar modulation**
- **Study terrestrial magnetosphere**

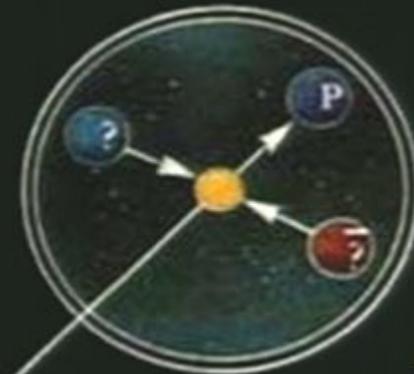

ANTIMATTER

Collision of High Energy Cosmic Rays with the Interstellar Gas

Annihilation of Exotic Particles

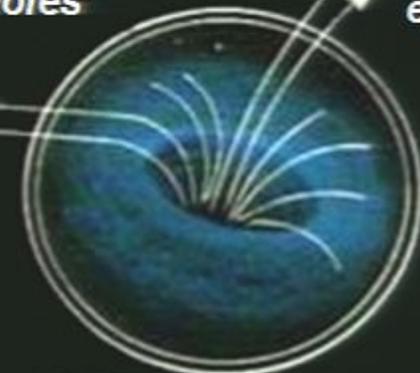

Cosmic Rays Leaking Out of Antimatter Galaxies

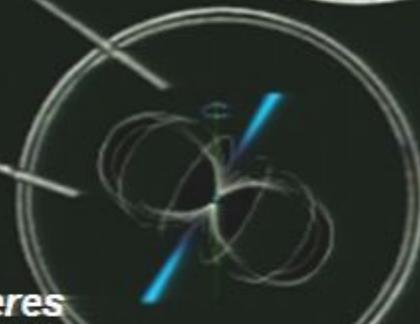

Antimatter Lumps In the Milky Way

Evaporation of Primordial Black Holes

Pulsar's magnetospheres

Design Performance

	<u>energy range</u>
• Antiprotons	80 MeV - 150 GeV
• Positrons	50 MeV – 300 GeV
• Electrons	up to 500 GeV
• Protons	up to 700 GeV
• Electrons+positrons	up to 2 TeV (from calorimeter)
• Light Nuclei (He/Be/C)	up to 200 GeV/n
• AntiNuclei search	sensitivity of 3×10^{-8} in $\overline{\text{He}}/\text{He}$

→ Simultaneous measurement of many cosmic-ray species

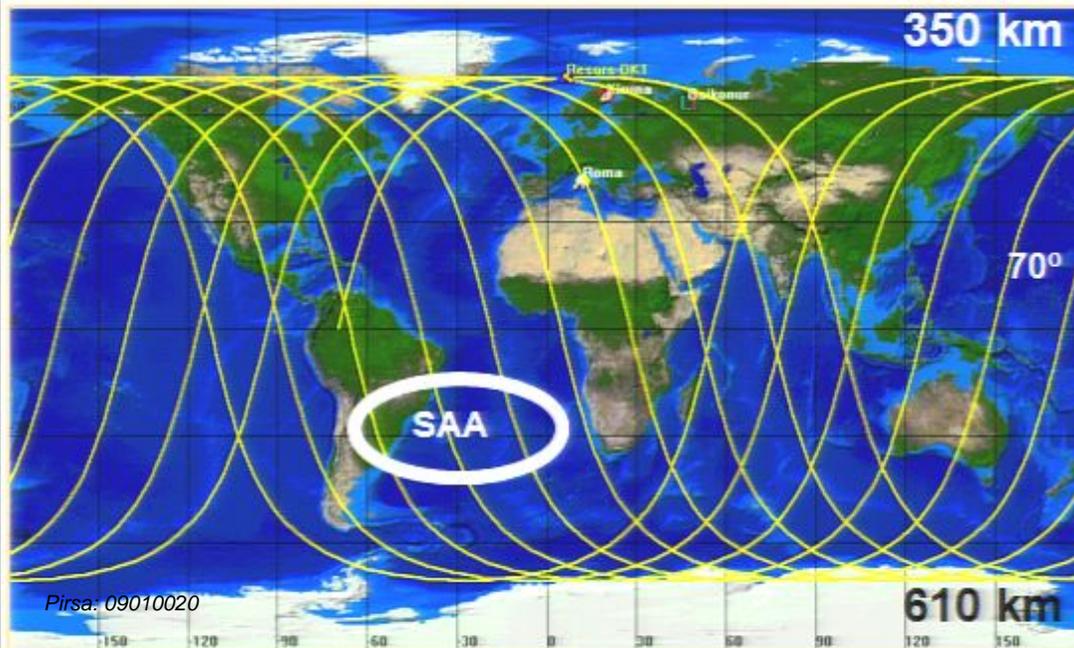

→ New energy range

→ Unprecedented statistics

Resurs-DK1 satellite + orbit

Resurs-DK1
Mass: 6.7 tonnes
Height: 7.4 m
Solar array area: 36 m²

Pirsa: 09010020

- Resurs-DK1: multi-spectral imaging of earth's surface
- PAMELA mounted inside a pressurized container
- Lifetime >3 years (assisted)
- Data transmitted to NTsOMZ, Moscow via high-speed radio downlink. ~16 GB per day
- Quasi-polar and elliptical orbit (70.0° , 350 km - 600 km)
- Traverses the South Atlantic Anomaly
- Crosses the outer (electron) Van Allen belt at south pole

PAMELA milestones

Launch from Baikonur → June 15th 2006, 0800 UTC.

'First light' → June 21st 2006, 0300 UTC.

- Detectors operated as expected after launch
- Different trigger and hardware configurations evaluated

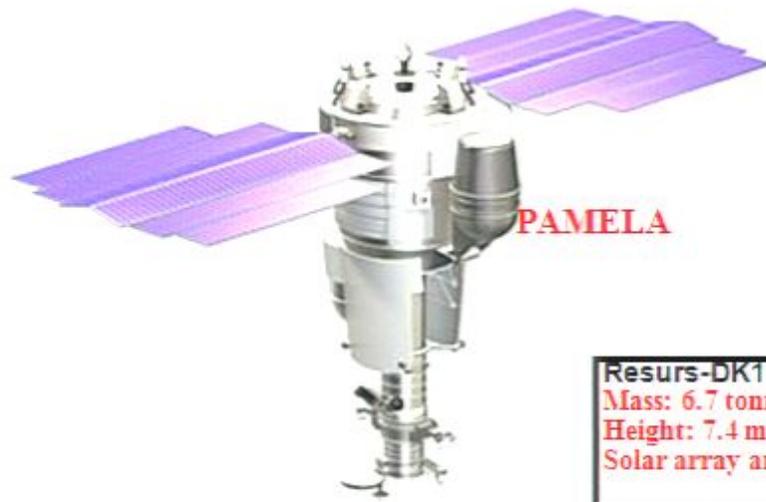

→ **PAMELA in continuous data-taking mode since commissioning phase ended on July 11th 2006**

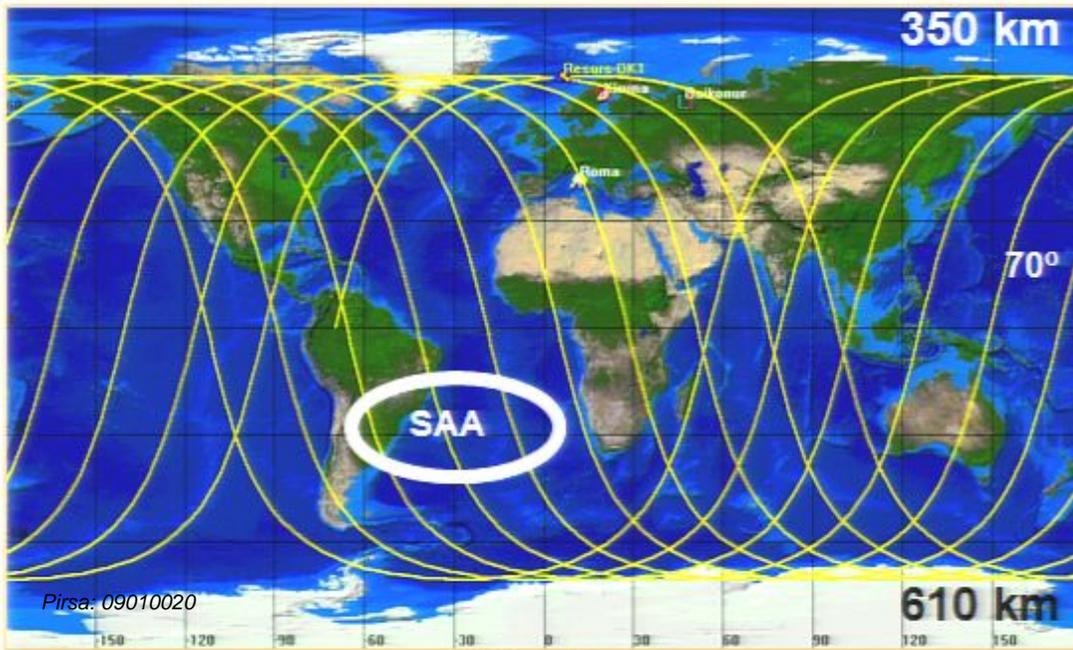

Trigger rate* ~25Hz
Fraction of live time* ~ 75%
Event size (compressed mode) ~5kB
25 Hz x 5 kB/ev → ~ 10 GB/day
(* outside radiation belts)

Till ~now:
~700 days of data taking
~12 TByte of raw data downlinked
~12•10⁸ triggers recorded and analyzed
(Data from April till now under analysis)

Analysis 'recipe'

- **Select downward-going particles with ToF ($\Delta t \sim 0.3$ ns)**
- **Select MIPs with dE/dx (ToF + tracker)**
- **Multiplicity cuts on S1/S2, AC to reject interactions**
- **Quality cuts on tracker fit, derive rigidity**
- **Check rigidity is compatible with geomagnetic location**
- **Use shower topology to reject electrons**
- **Use ToF β for particle ID, < 1 GeV/c**

Calorimeter Selection

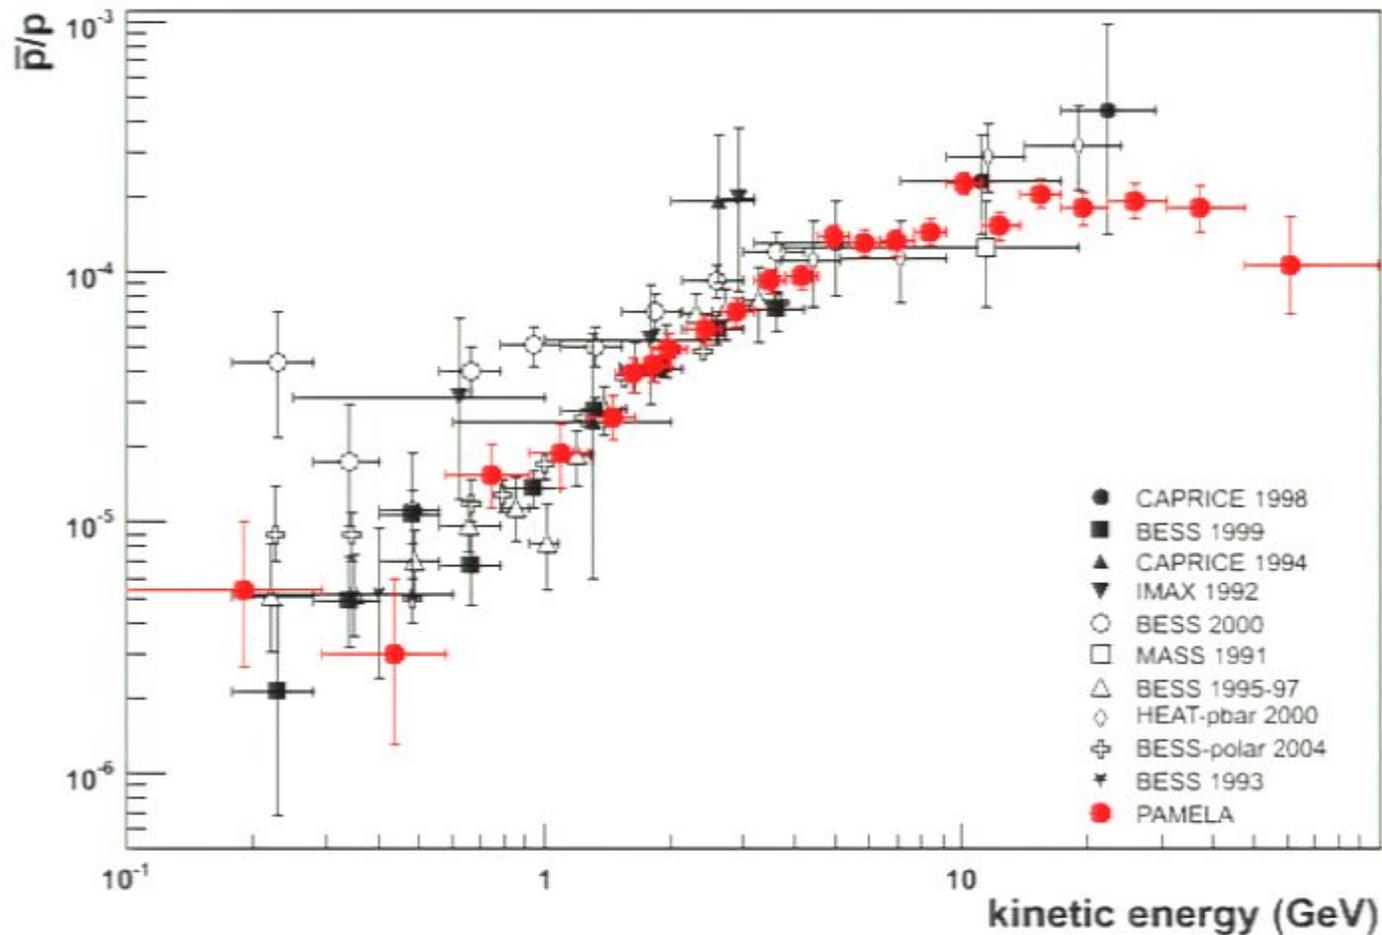

Proton Background

- Spectrometer tracking information is crucial for high-energy antiproton selection
- Finite spectrometer resolution - high rigidity protons may be assigned wrong sign-of-charge
- Also background from scattered protons
- Eliminate 'spillover' using strict track cuts (χ^2 , lever arm, no δ -rays, etc)
- $\text{MDR} > 10 \times$ reconstructed rigidity
- Spillover limit for antiprotons expected to be ~ 200 GeV.

Proton / positron discrimination

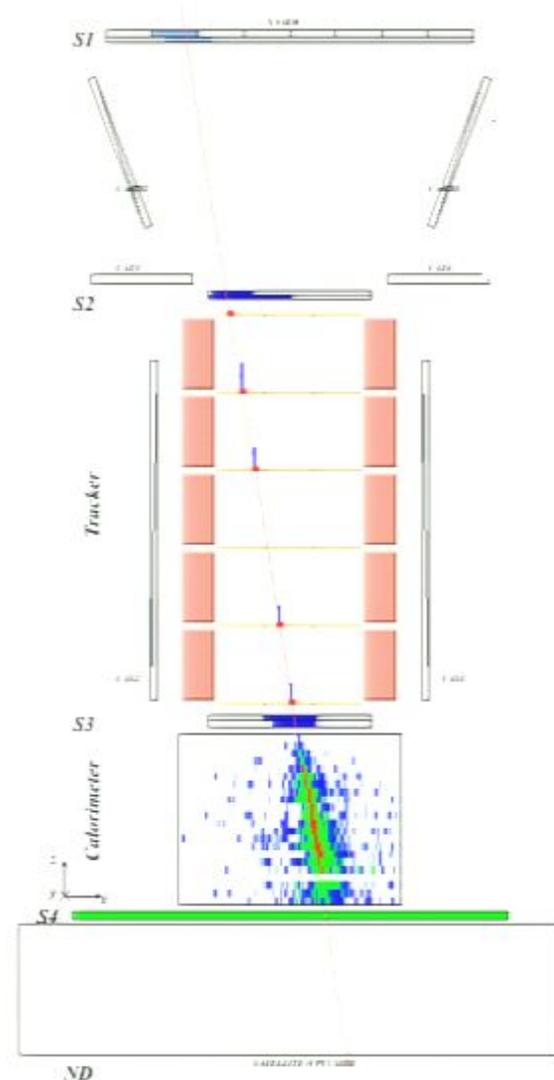

Time-of-flight:
trigger, albedo
rejection, mass
determination (up
to 1 GeV)

**Bending in
spectrometer:**
sign of charge

**Ionisation energy
loss (dE/dx):**
magnitude of charge

**Interaction pattern
in calorimeter:**
electron-like or
proton-like,
electron energy

Positron selection with calorimeter

Analysis key points:

- test beam data
- simulation
- flight data dE/dx
- flight data neutron detector
- from flight data pure proton sample (“pre-sampler method”):
 - flight data background suppression with “standard” cuts
 - flight data background suppression with multi-variate data analysis (TMVA)
 - flight data background estimation

Positron selection with calorimeter

Analysis key points:

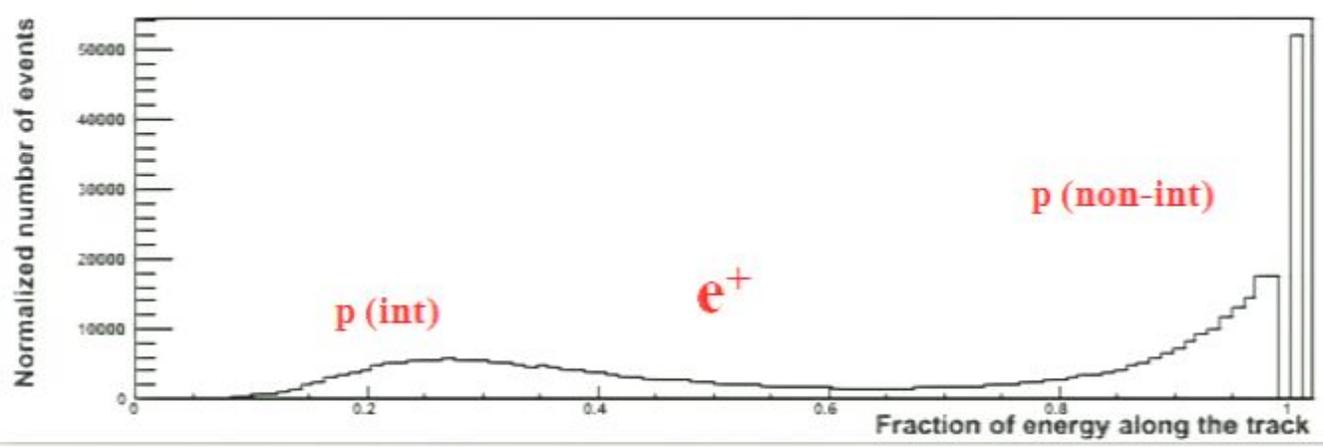

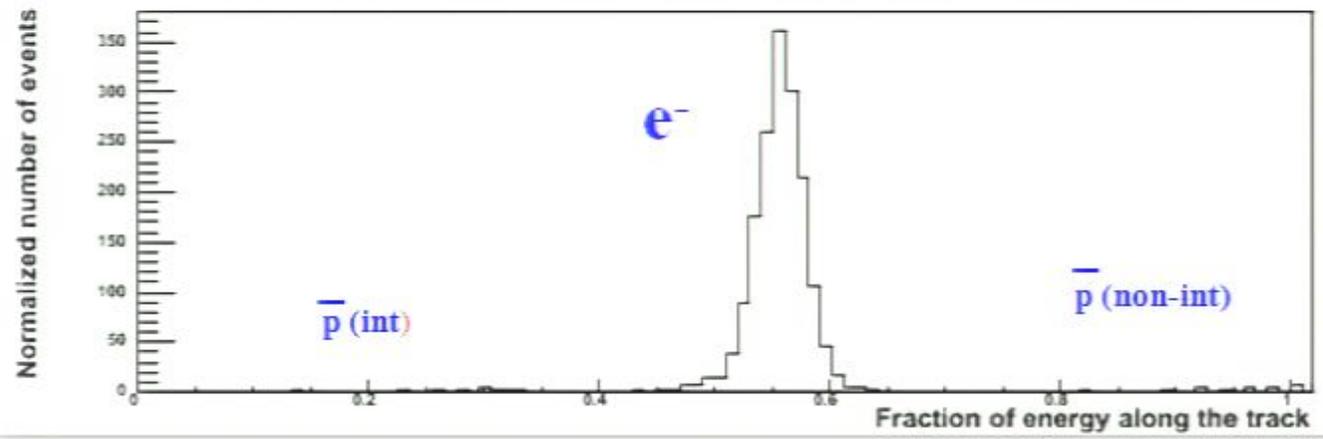

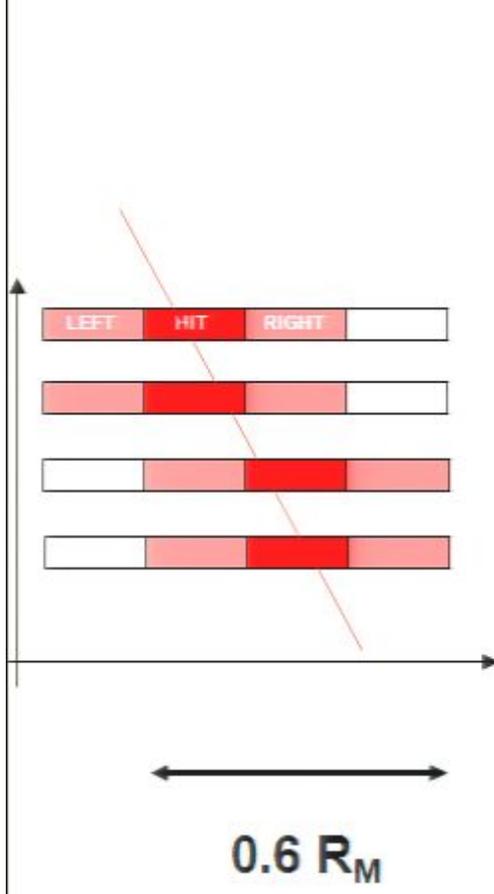

- test beam data
- simulation
- flight data dE/dx
- flight data neutron detector
- from flight data pure proton sample (“pre-sampler method”):
 - flight data background suppression with “standard” cuts
 - flight data background suppression with multi-variate data analysis (TMVA)
 - flight data background estimation

Final results make no use of test-beam and/or simulation calibrations.

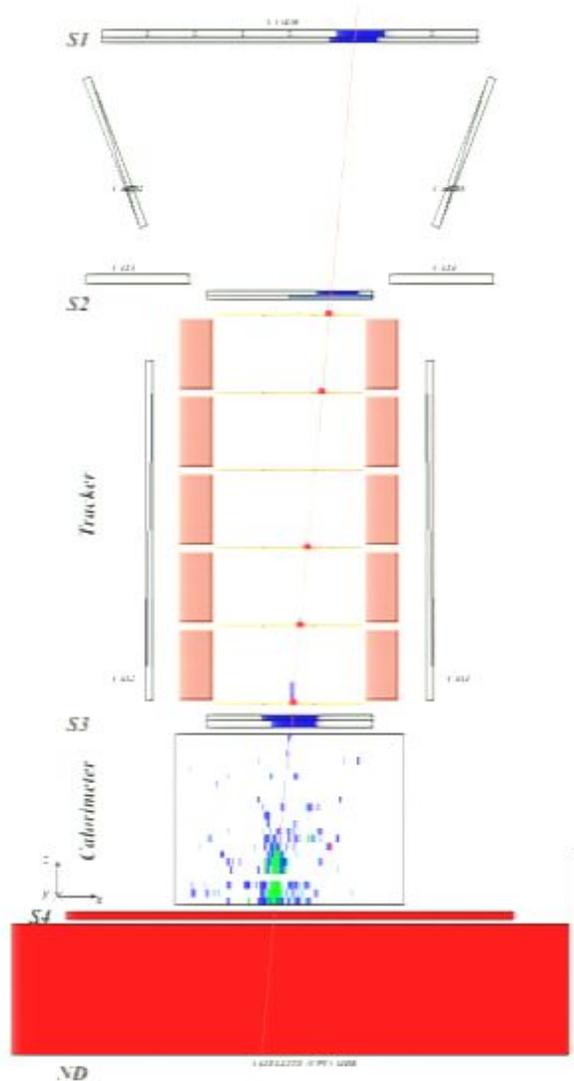

The measurement is based only on flight data with the “background estimation” method

Positron selection with calorimeter

Fraction of energy released along the calorimeter track (left, hit, right)

Proton / positron discrimination

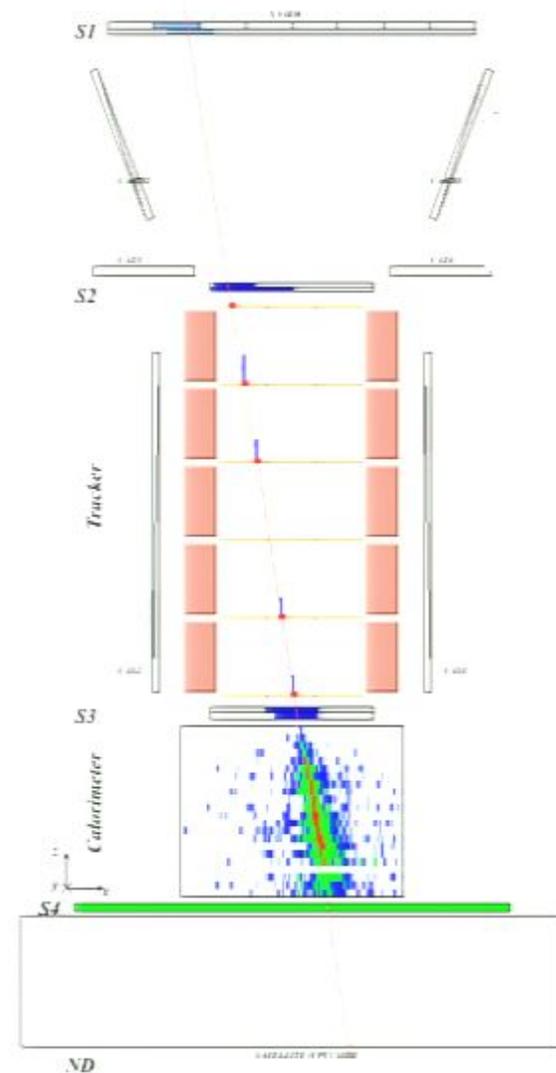

Time-of-flight:
trigger, albedo
rejection, mass

Example: pulsars

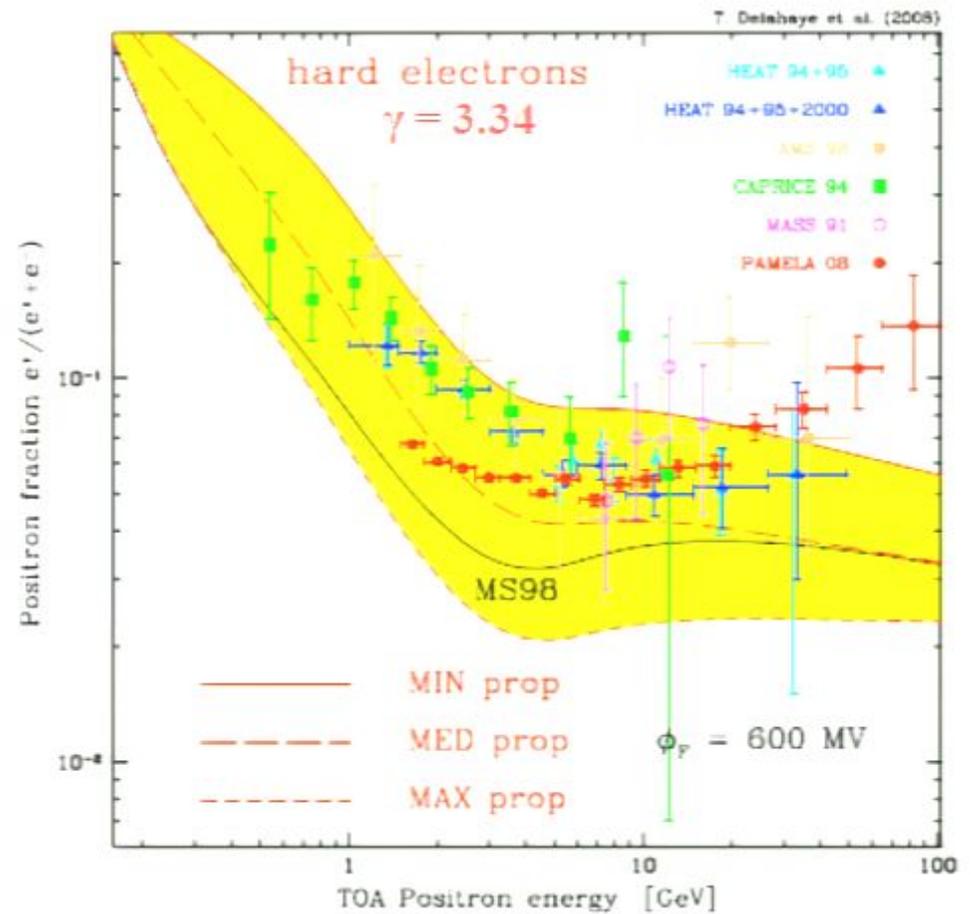

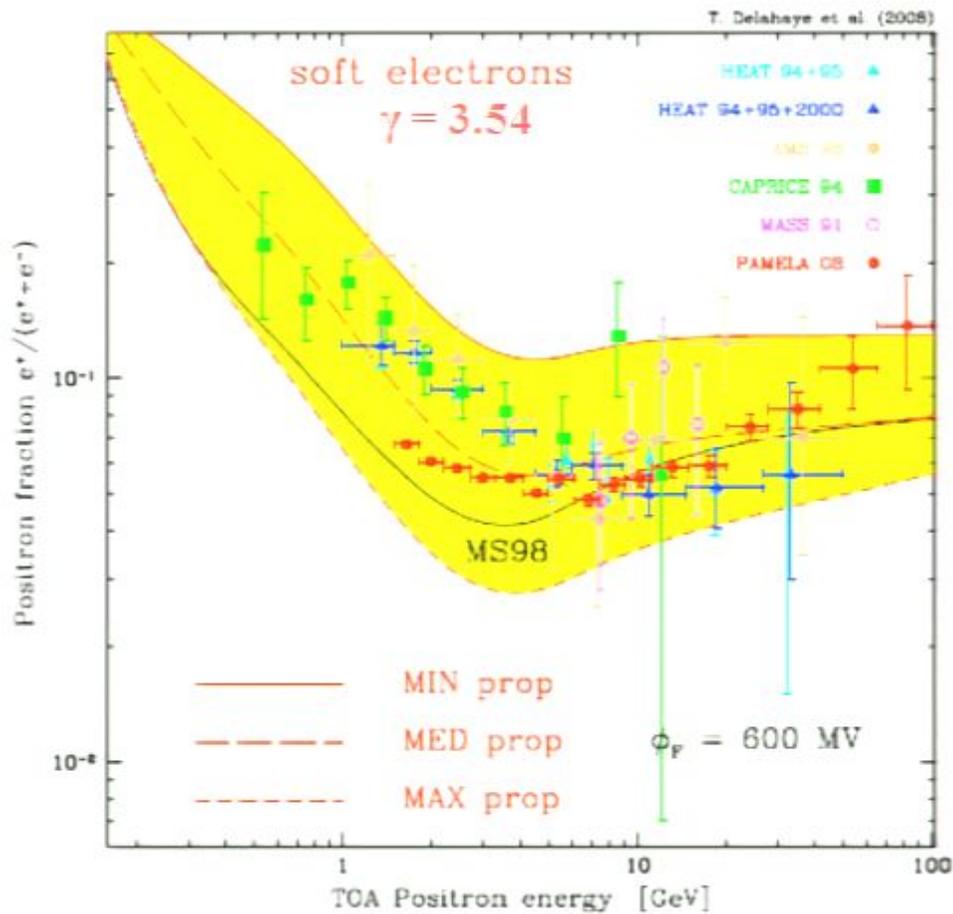

H. Yüksak et al., arXiv:0810.2784v2
 Contributions of e^- & e^+ from
 Geminga assuming different distance,
 age and energetic of the pulsar

Hooper, Blasi, and Serpico
 arXiv:0810.1527

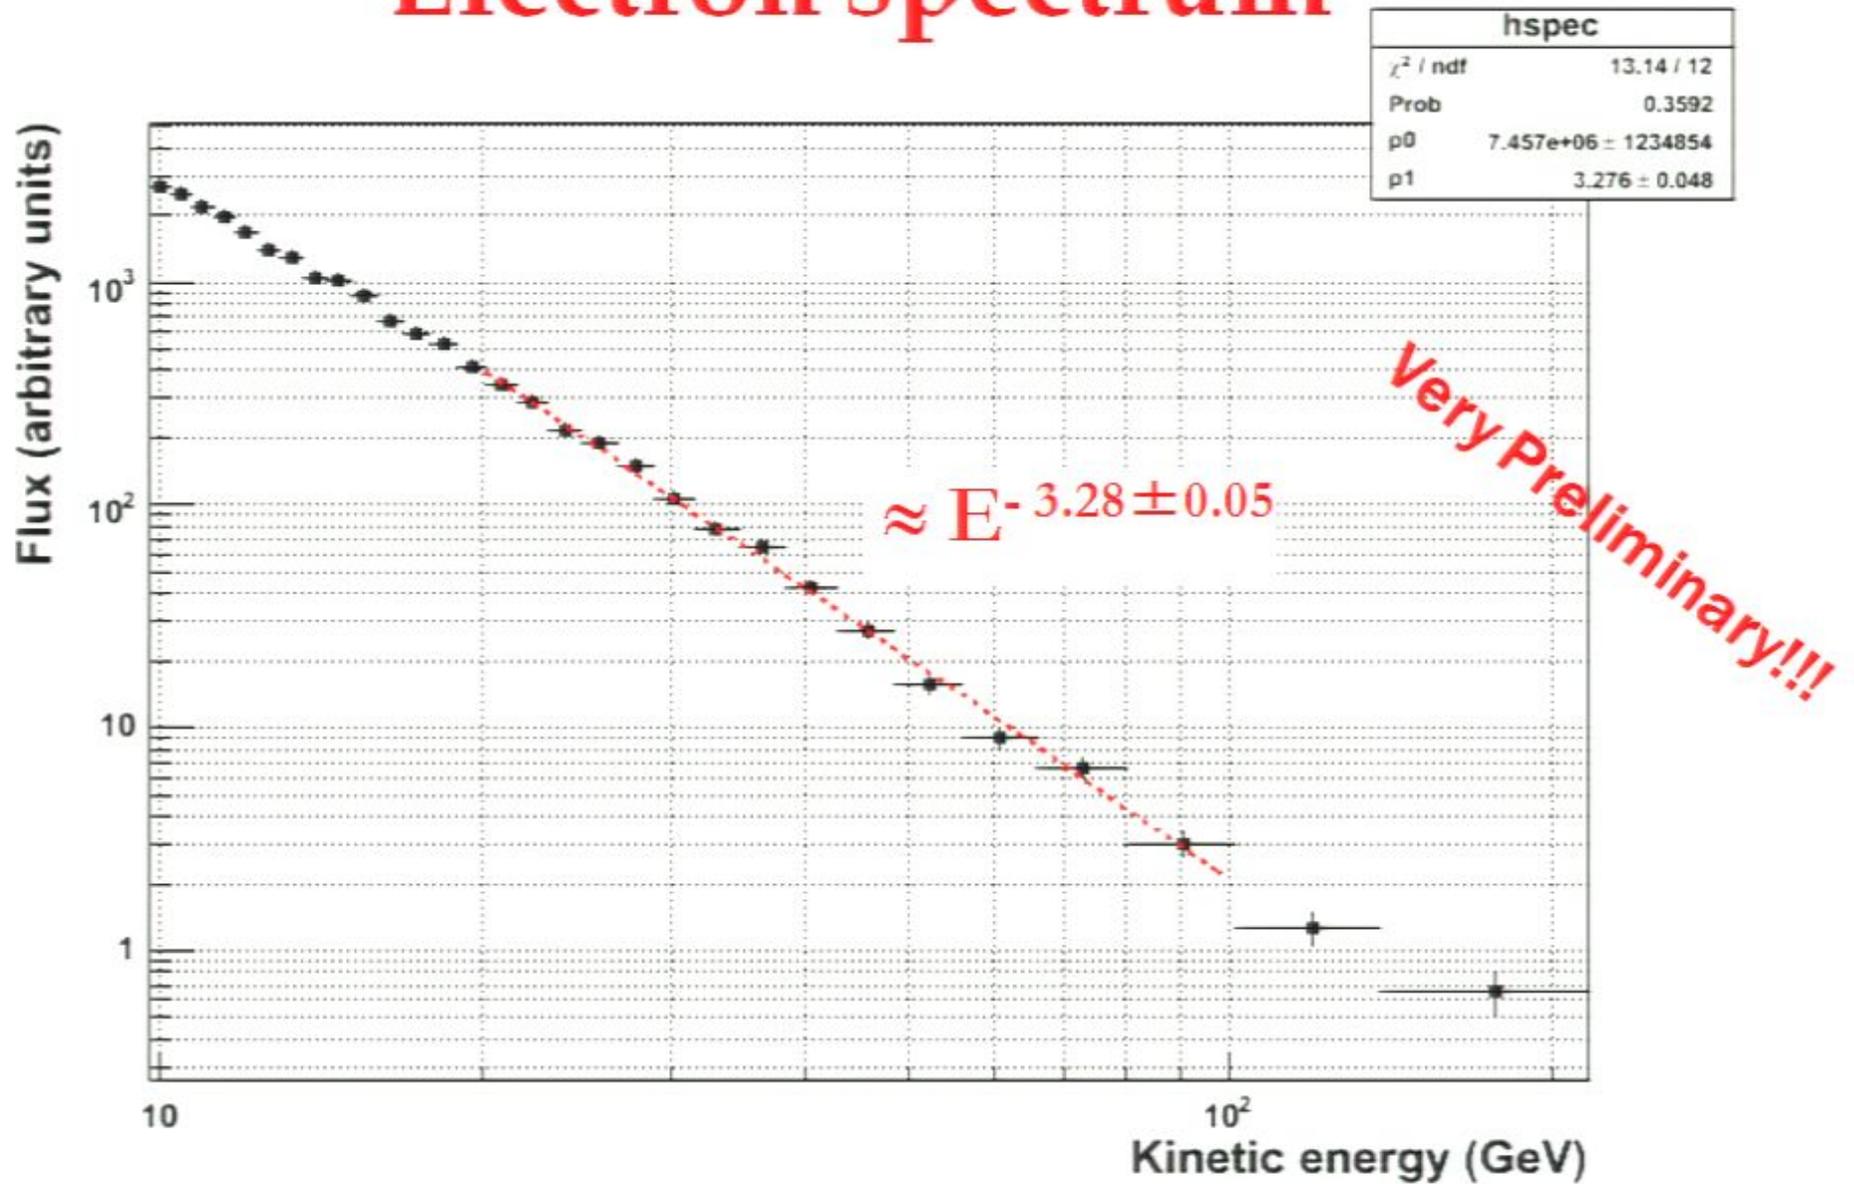

Theoretical uncertainties on “standard” positron fraction

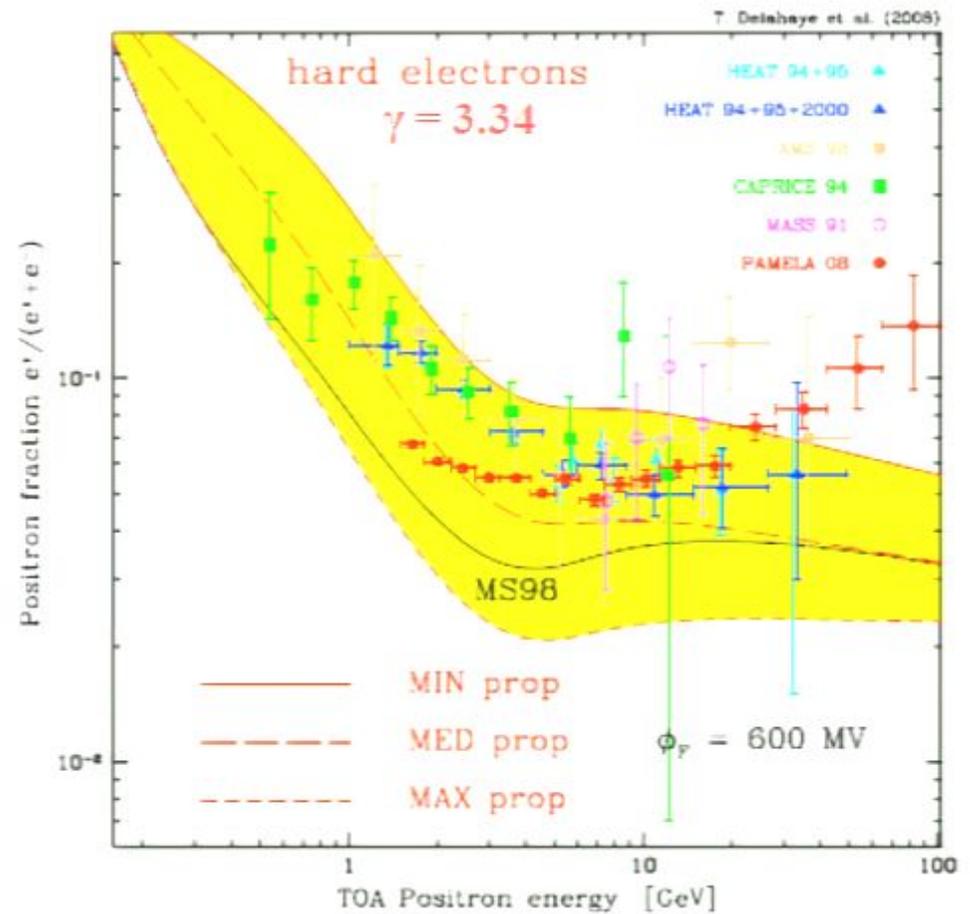

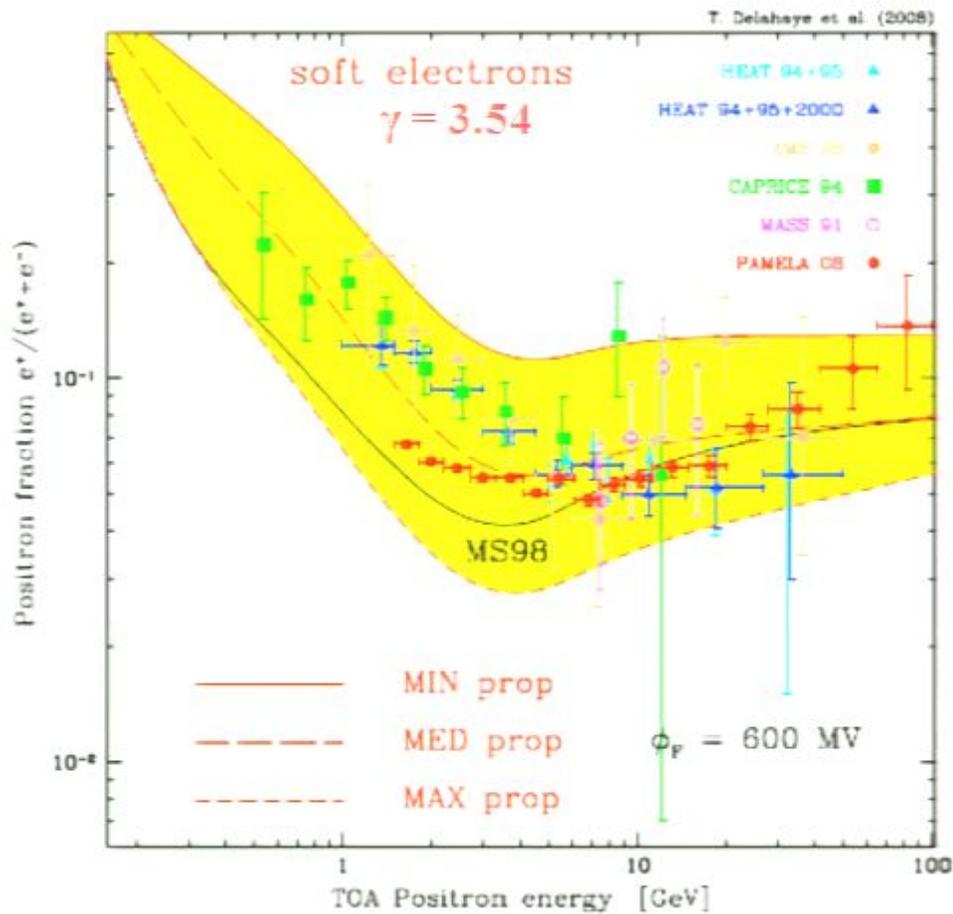

T. Delahaye et al., arXiv: 0809.5268v3

Electron spectrum

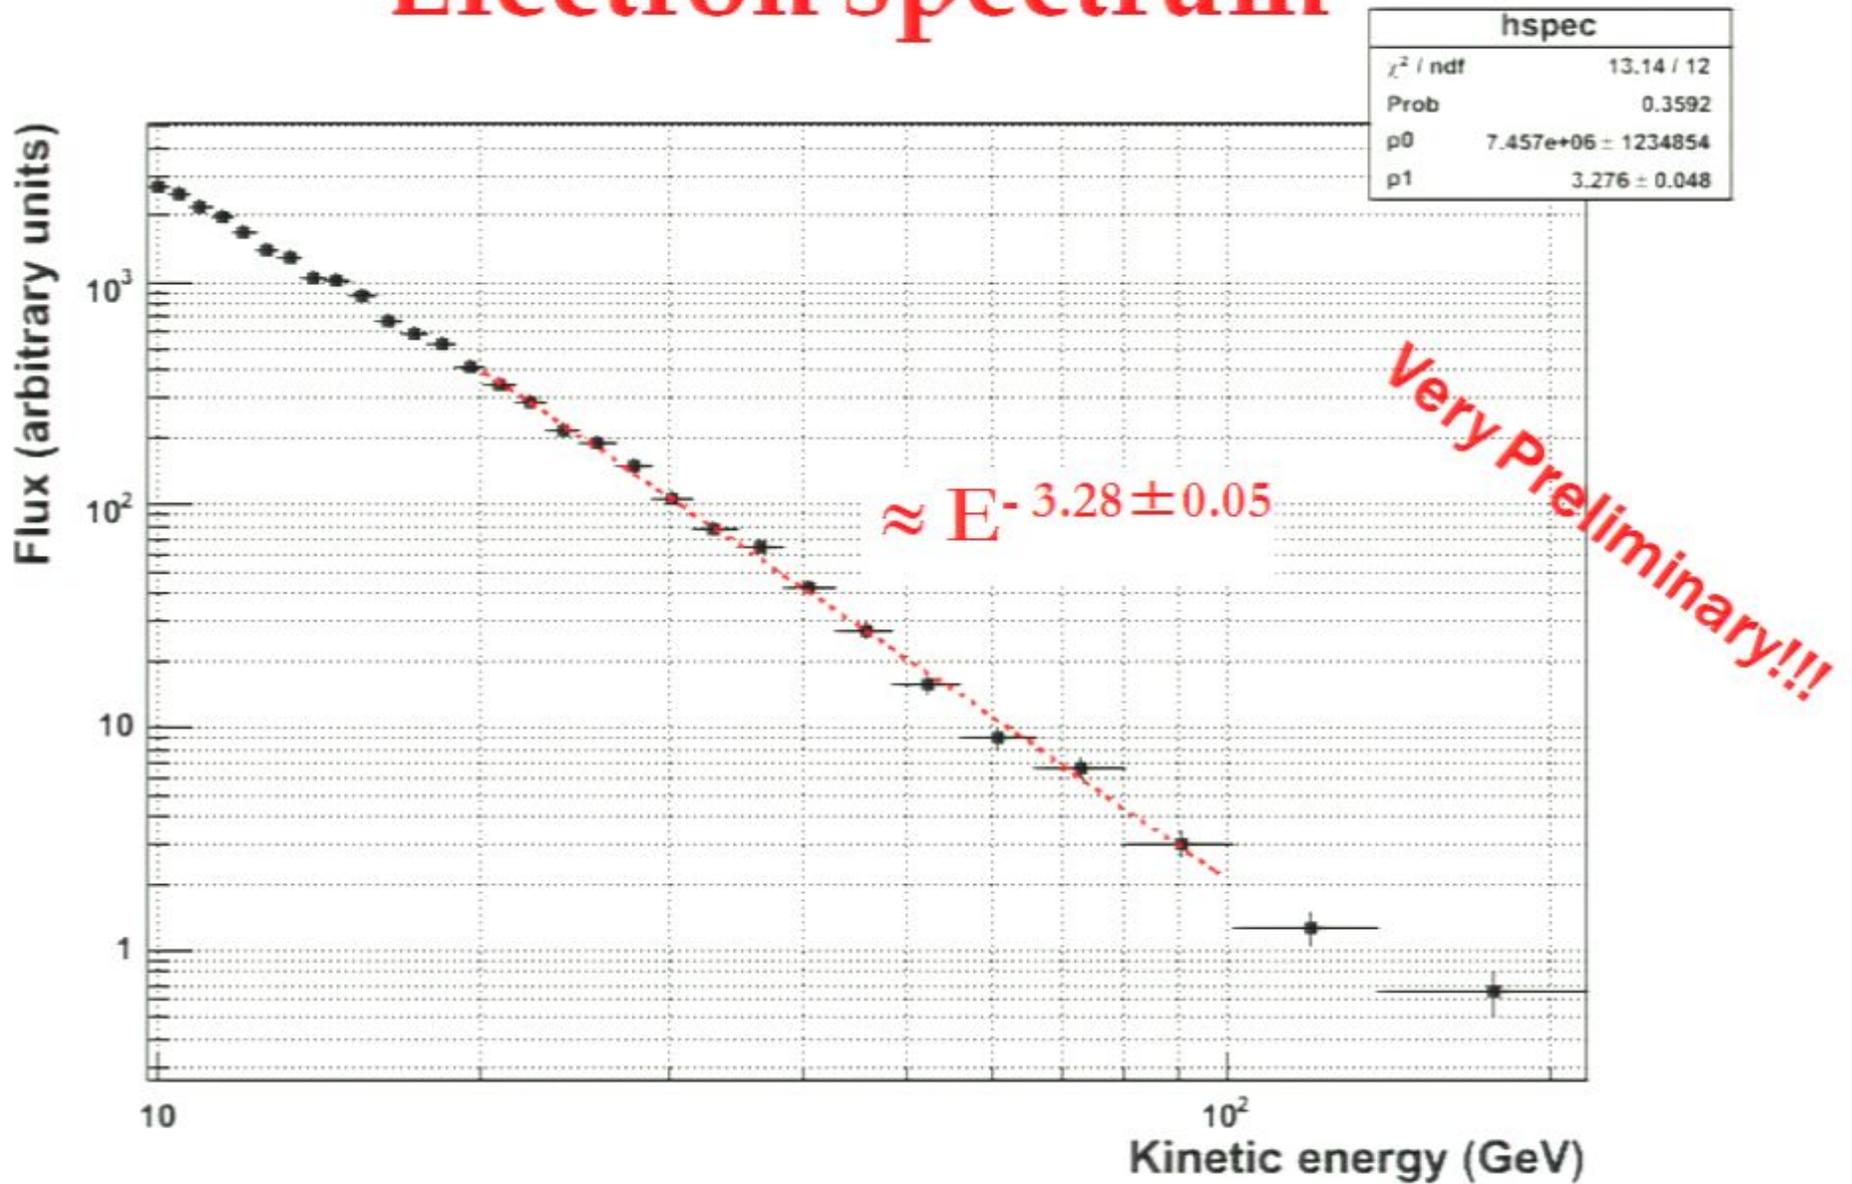

Theoretical uncertainties on “standard” positron fraction

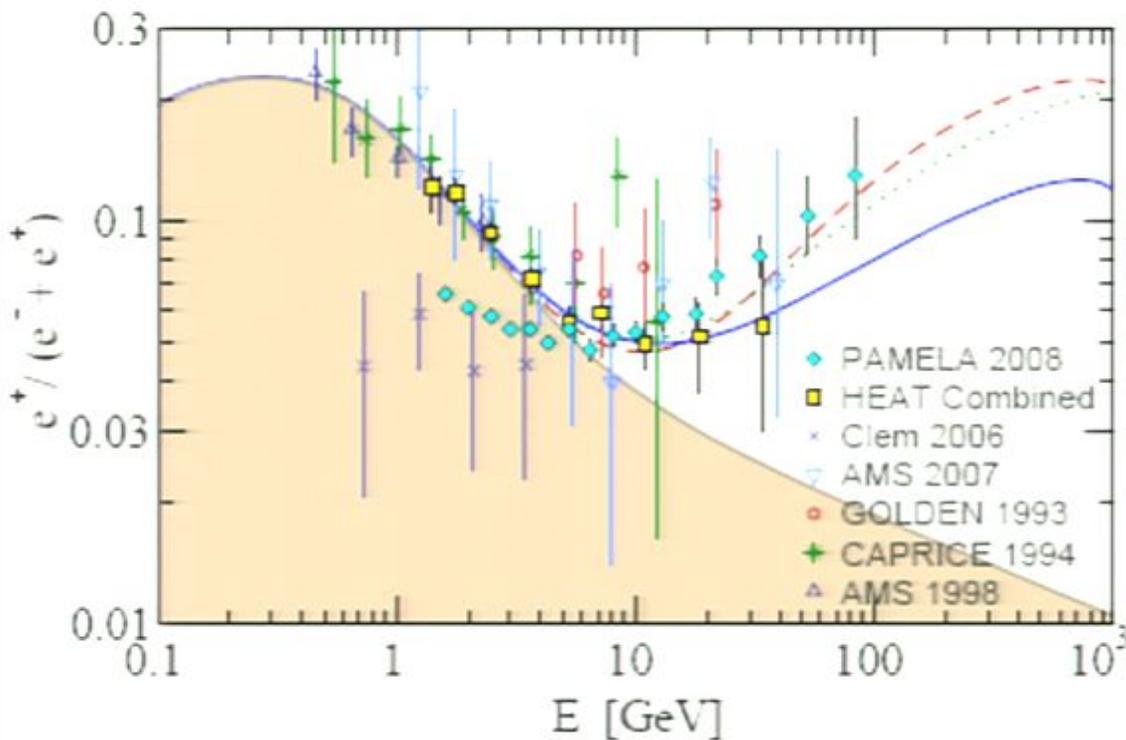

T. Delahaye et al., arXiv: 0809.5268v3

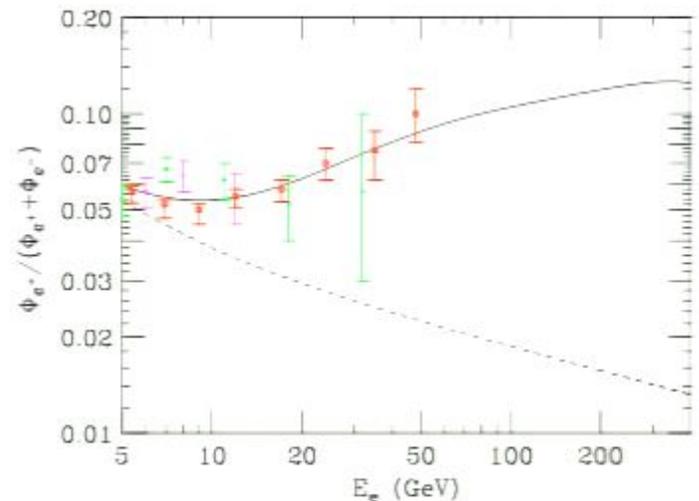

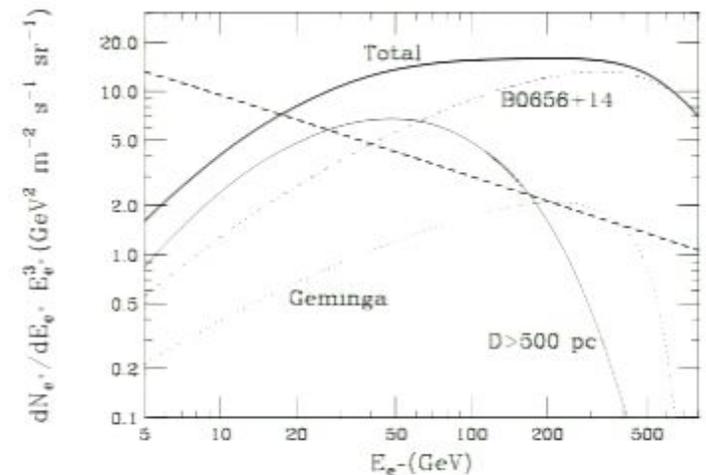

Electron spectrum

Example: pulsars

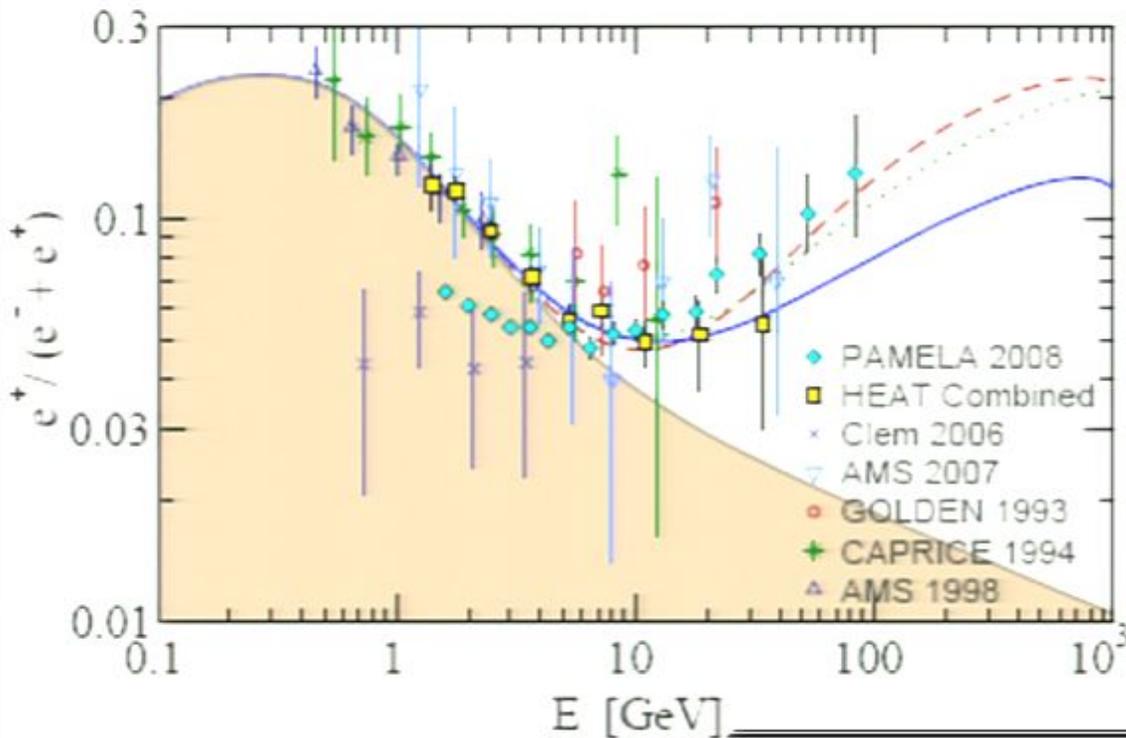

H. Yüksak et al., arXiv:0810.2784v2
 Contributions of e^- & e^+ from
 Geminga assuming different distance,
 age and energetic of the pulsar

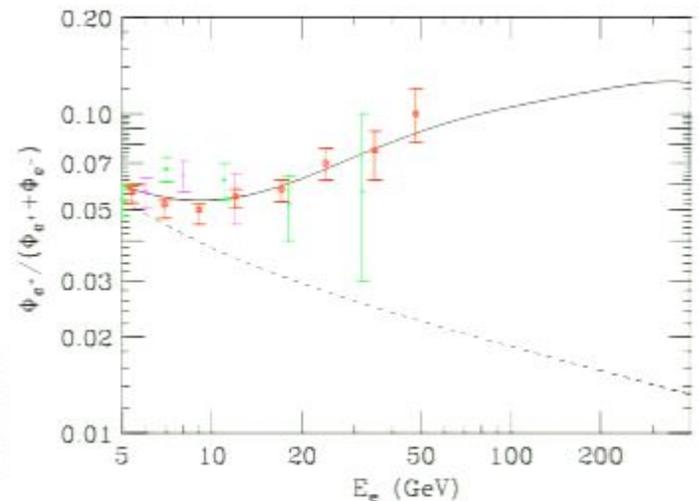

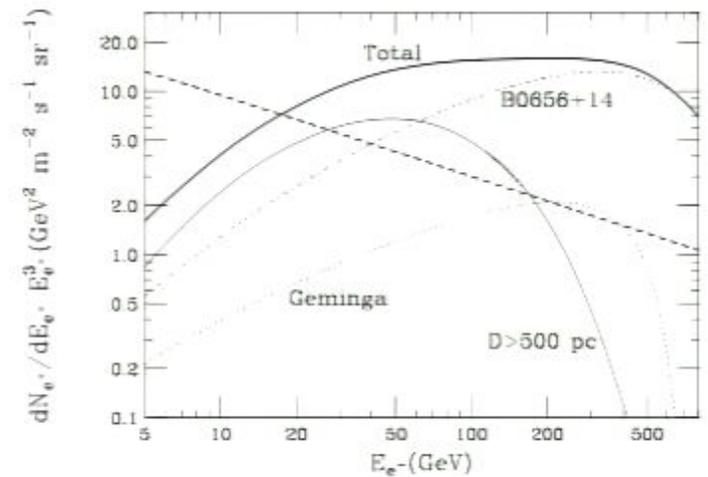

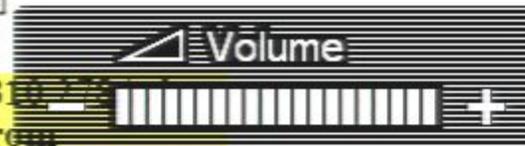

Hooper, Blasi, and Serpico
 arXiv:0810.1527

 Contributions of e^- & e^+ from
 Geminga assuming different distance,
 age and energetic of the pulsar

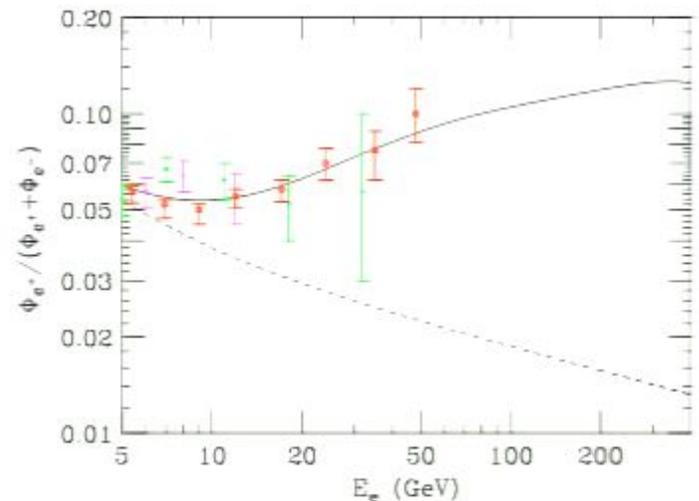

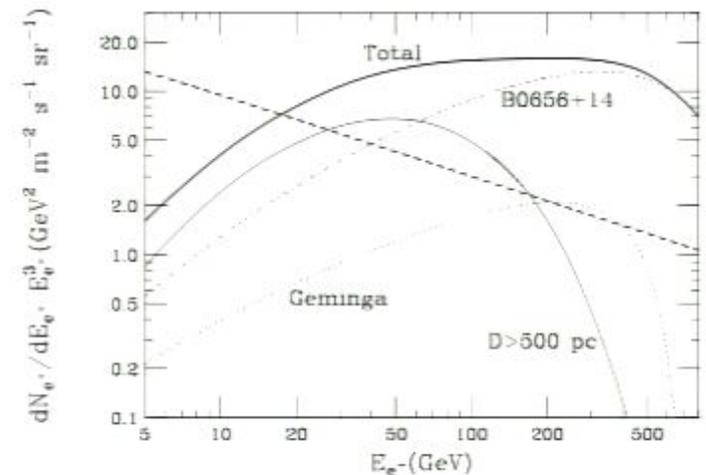

Hooper, Blasi, and Serpico
 arXiv:0810.1527

PAMELA \bar{p}/p implication on DM

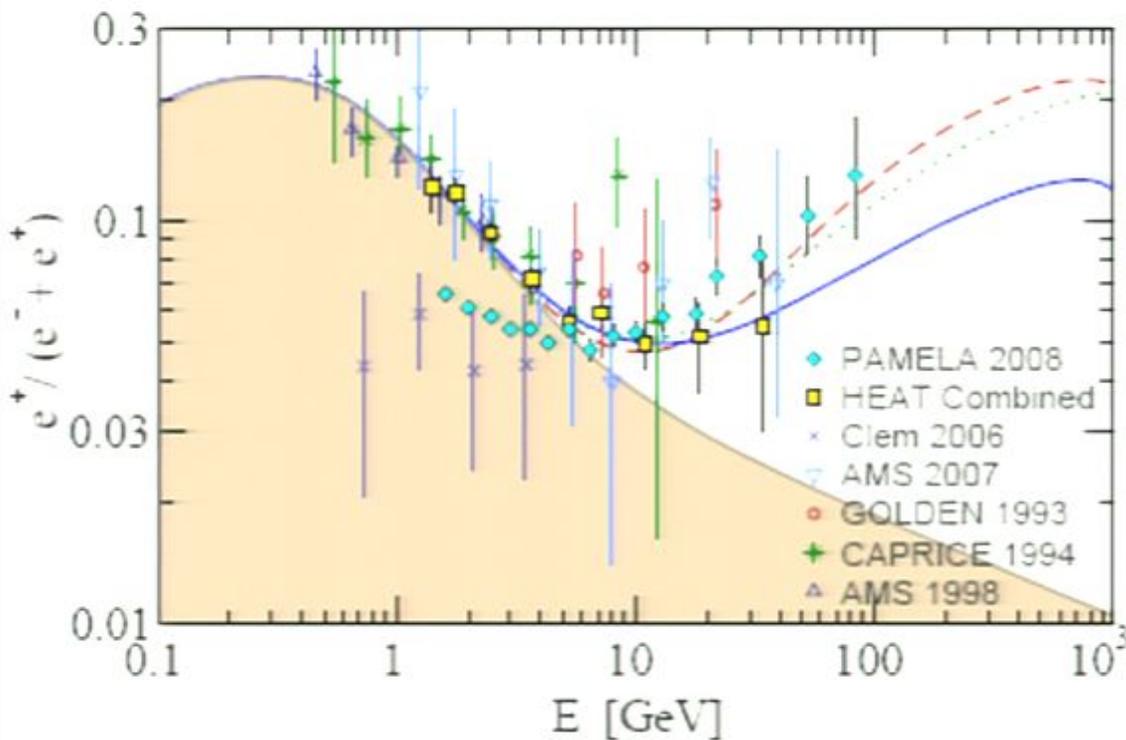

Secondary Production Models

Donato et al., arXiv: 0810.5292v1

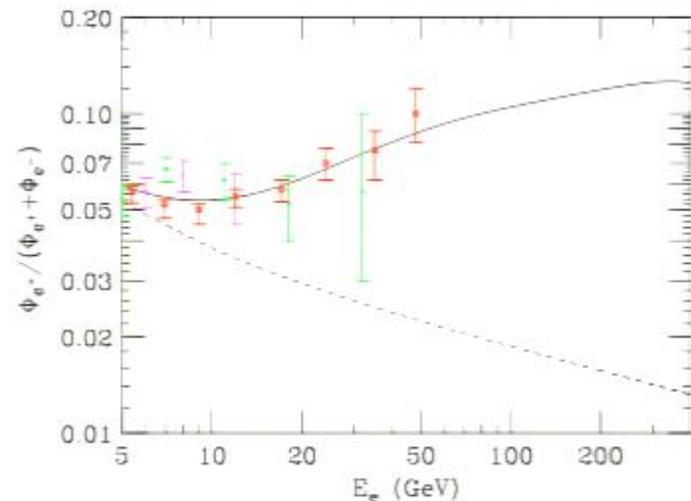

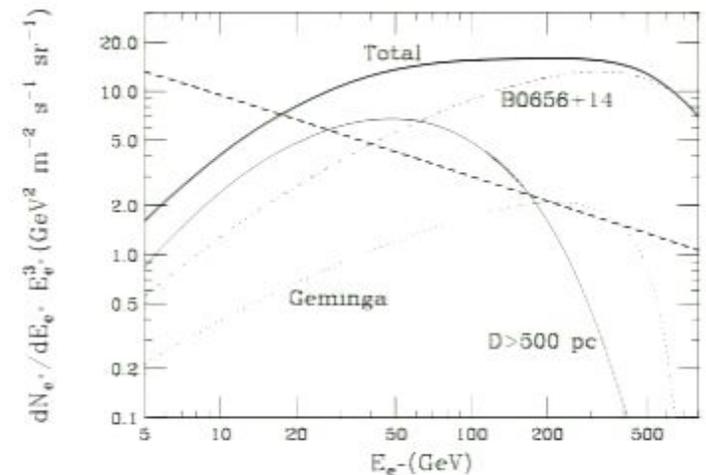

Upper limit for enhancement factor for thermal WIMP DM flux as a function of the WIMP mass

Example: pulsars

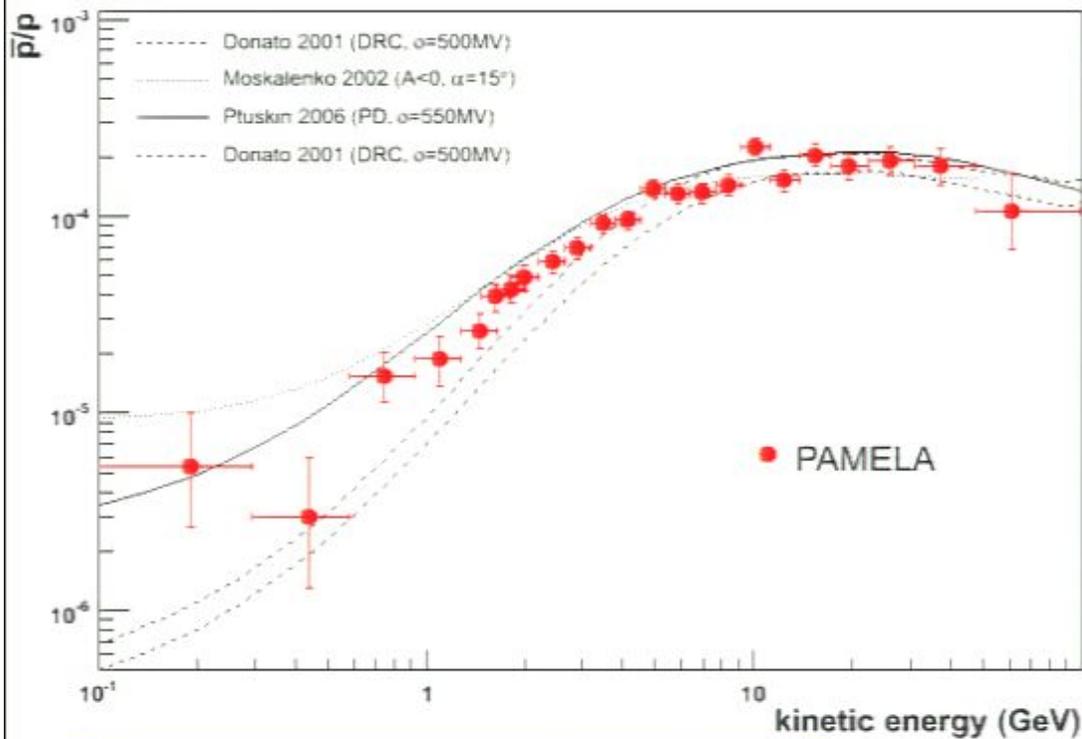

H. Yüksak et al., arXiv:0810.2784v2
 Contributions of e^- & e^+ from
 Geminga assuming different distance,
 age and energetic of the pulsar

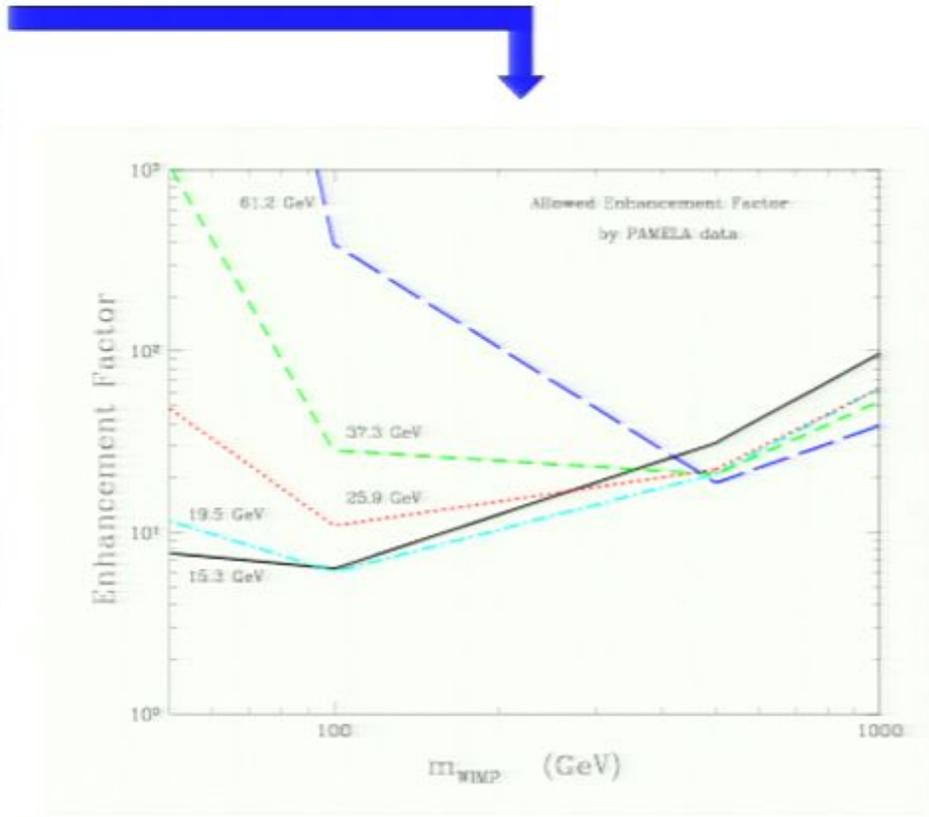

Hooper, Blasi, and Serpico
 arXiv:0810.1527

PAMELA \bar{p}/p implication on DM

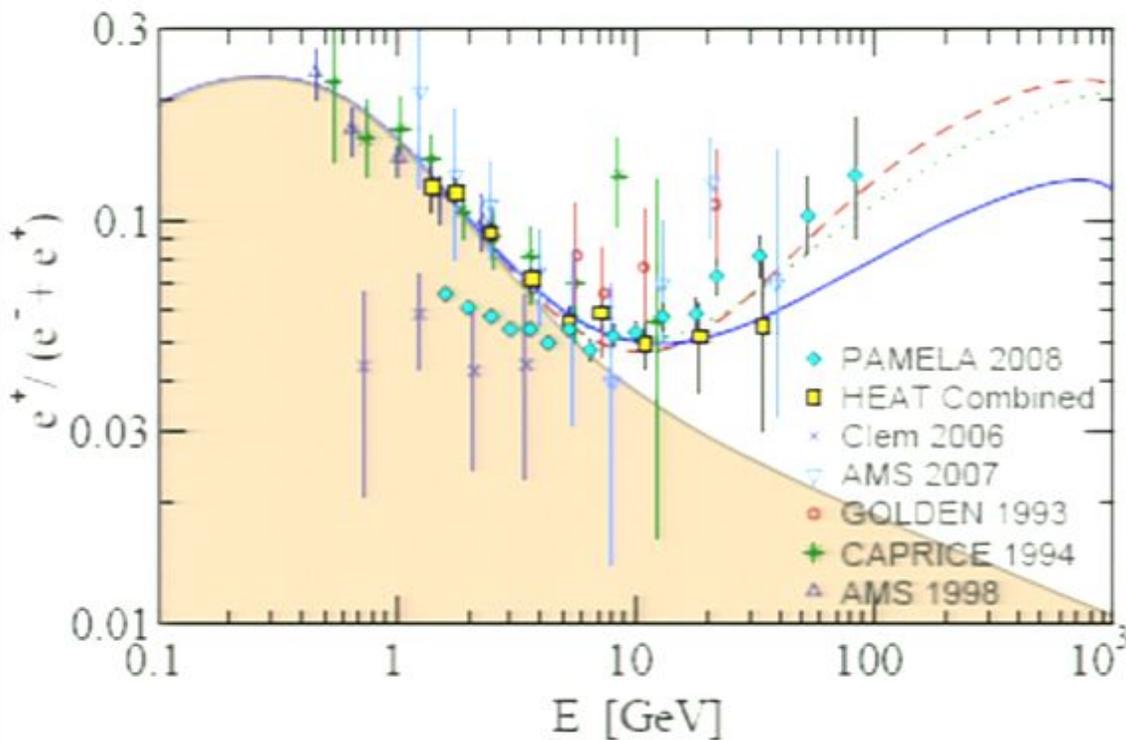

Secondary Production Models

Donato et al., arXiv: 0810.5292v1

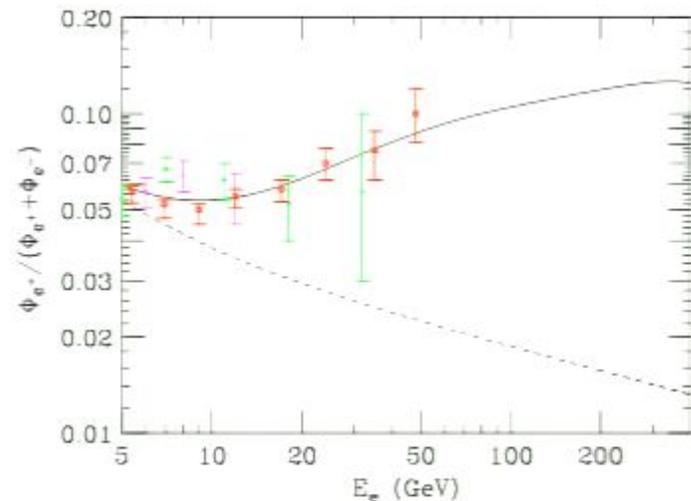

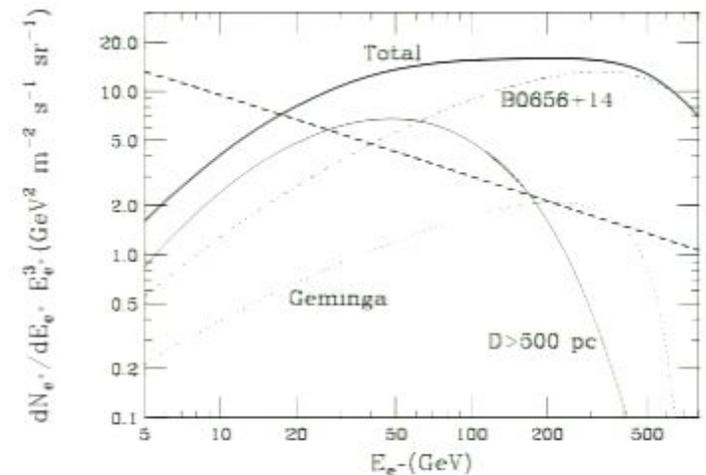

Upper limit for enhancement factor for thermal WIMP DM flux as a function of the WIMP mass

Example: DM

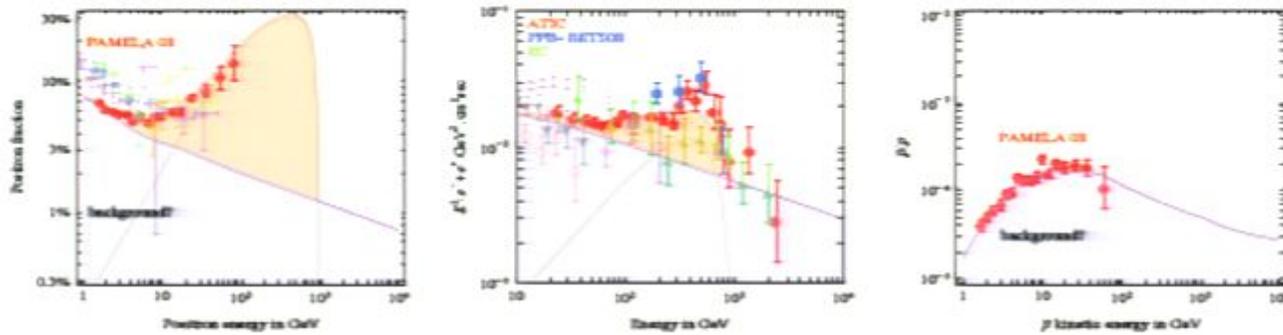

Example: e^- , $e^- + e^+$, \bar{p} with DM

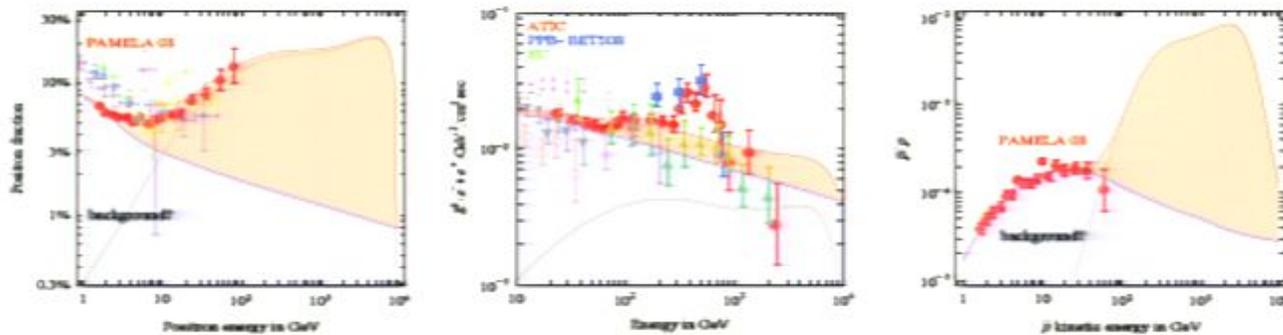

DM with $M_\chi = 150$ GeV that annihilates into W^+W^-

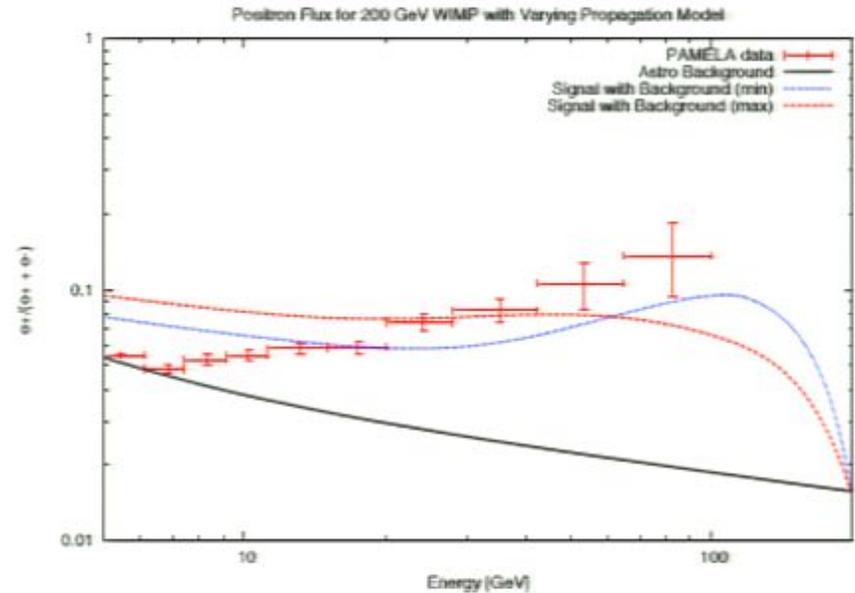

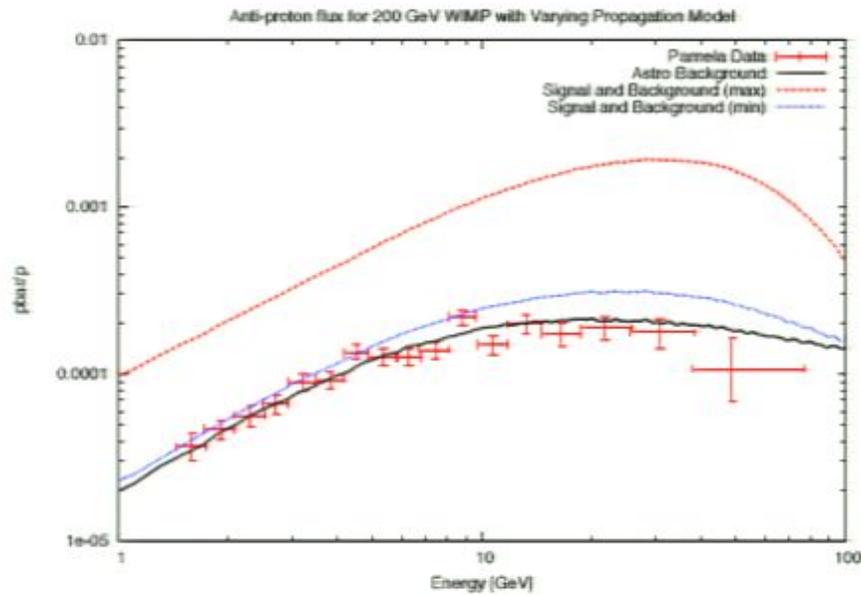

DM with $M_\chi = 1$ TeV that annihilates into $\mu^+\mu^-$

DM with $M_\chi = 10$ TeV that annihilates into W^+W^-

Example: e^+ & \bar{p} DM

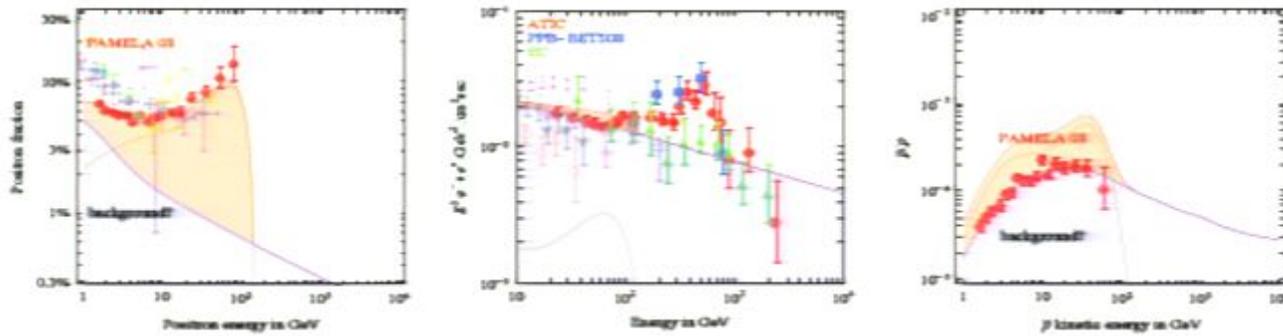

P. Grajek et al., arXiv: 0812.4555v1
Non-thermal wino-like neutralino
Varying propagation model, no boost factor

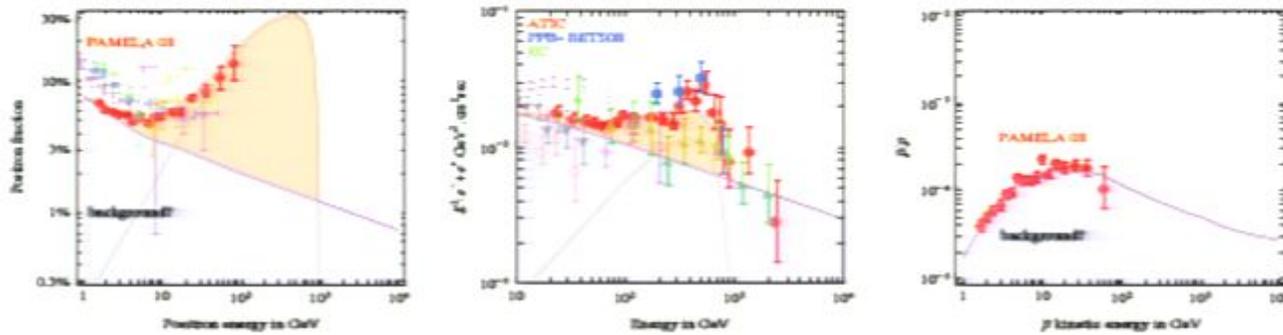

Example: e^- , $e^- + e^+$, \bar{p} with DM

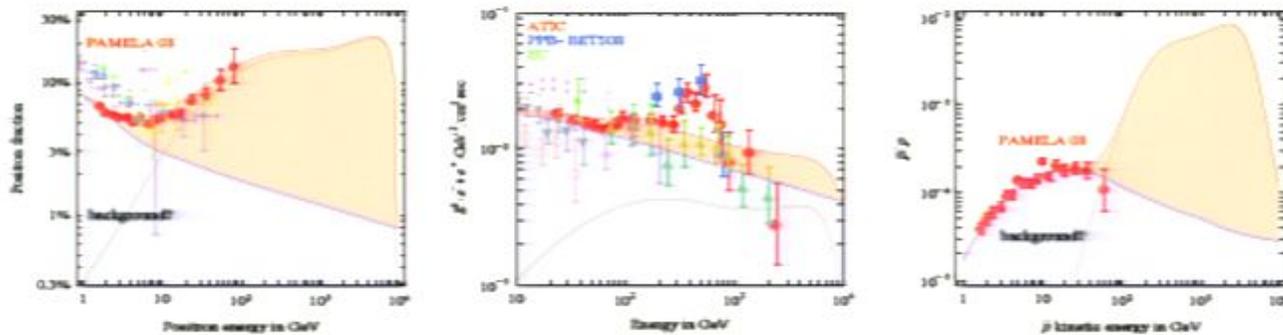

DM with $M_\chi = 150$ GeV that annihilates into $W^+ W^-$

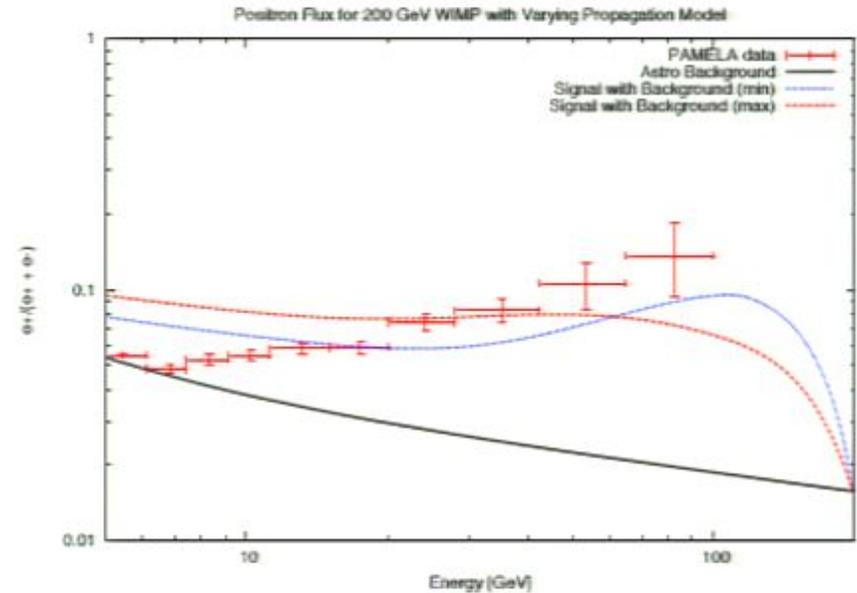

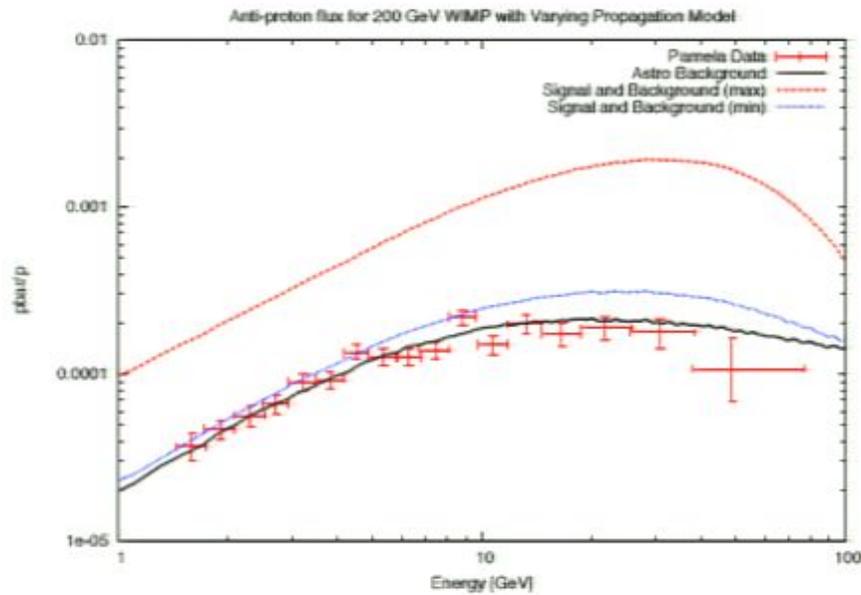

DM with $M_\chi = 1$ TeV that annihilates into $\mu^+ \mu^-$

DM with $M_\chi = 10$ TeV that annihilates into $W^+ W^-$

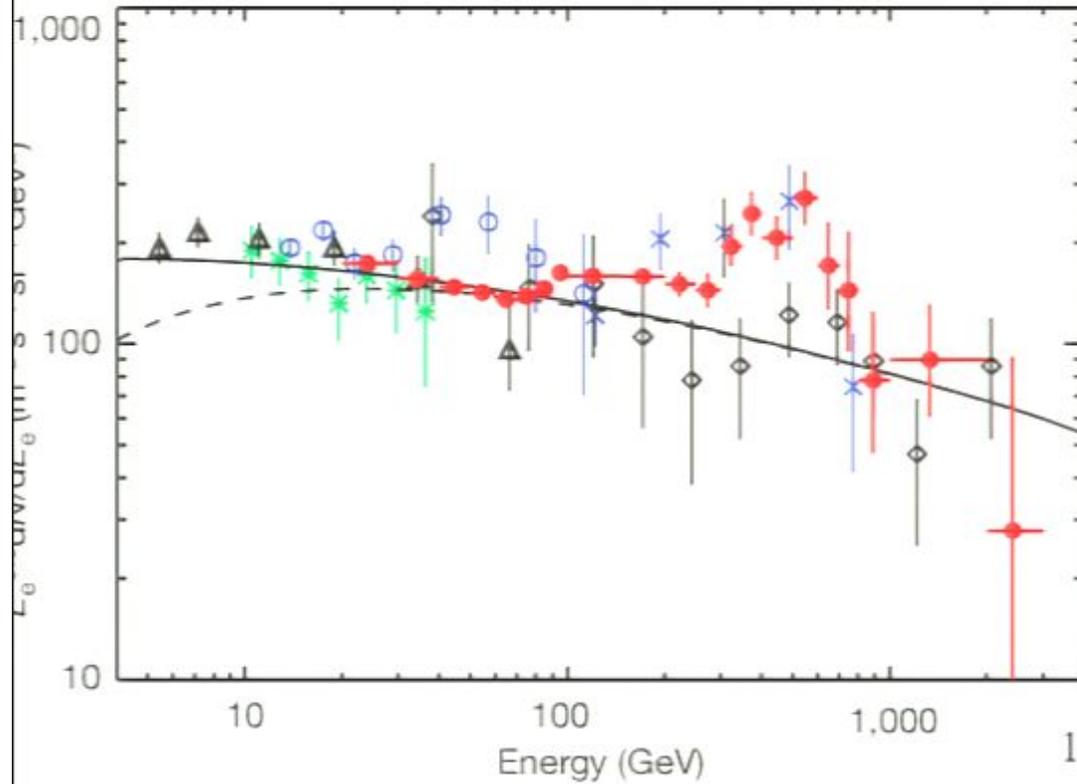

Example: e^+ & \bar{p} DM

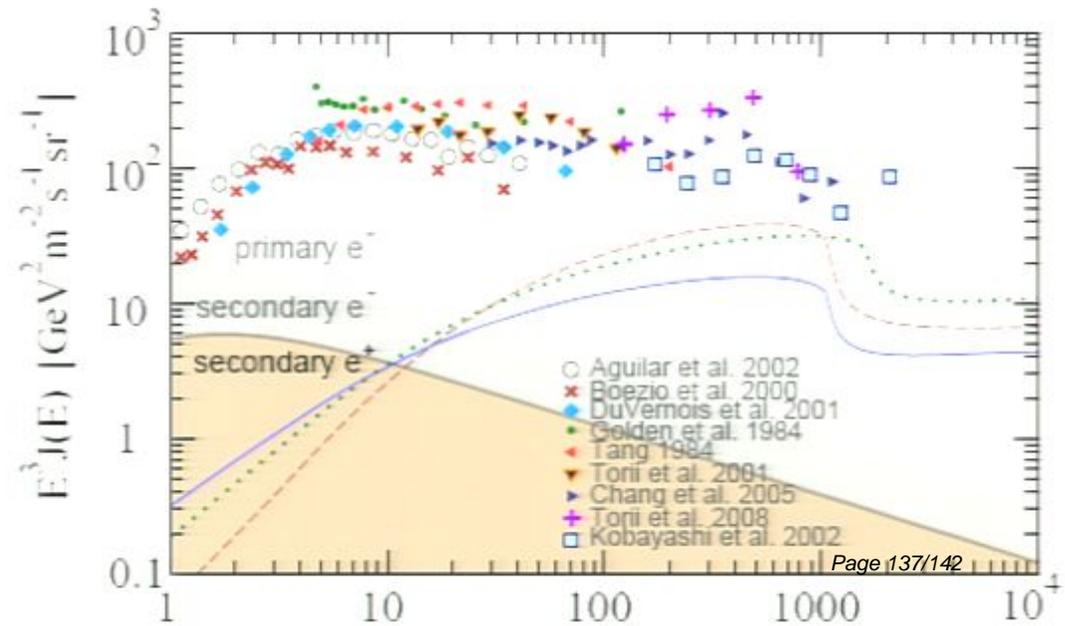

P. Grajek et al., arXiv: 0812.4555v1
Non-thermal wino-like neutralino
Varying propagation model, no boost factor

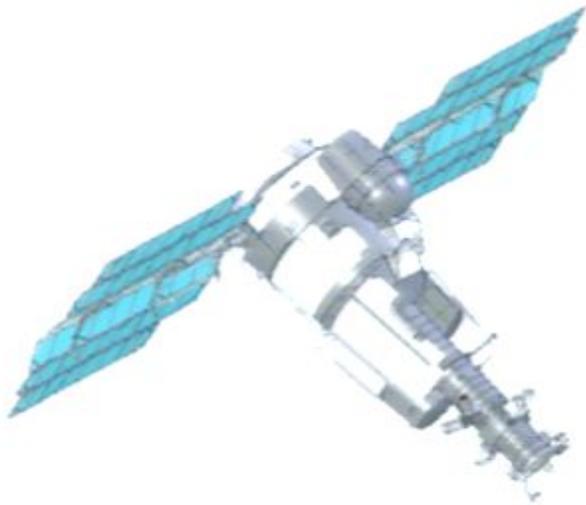

J. Chang et al. Nature 456, 362-365 (2008)

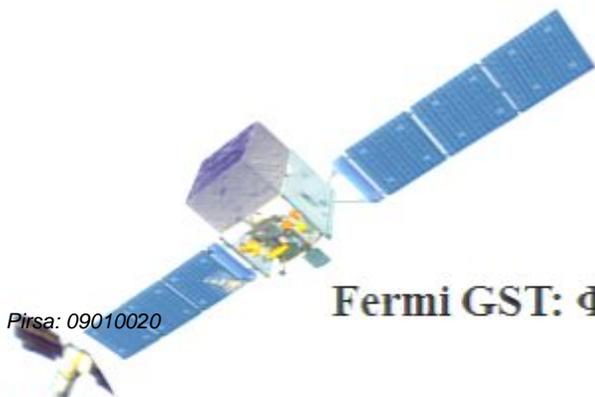

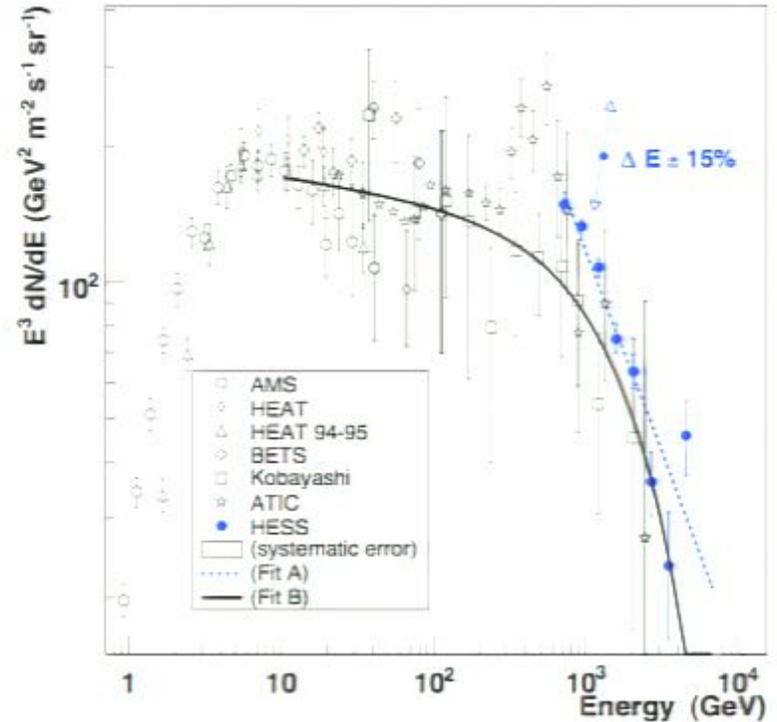

**H. Yüksak et al., arXiv:0810.2784v2
Contributions of e^- & e^+ from
Geminga assuming different distance,
age and energetic of the pulsar**

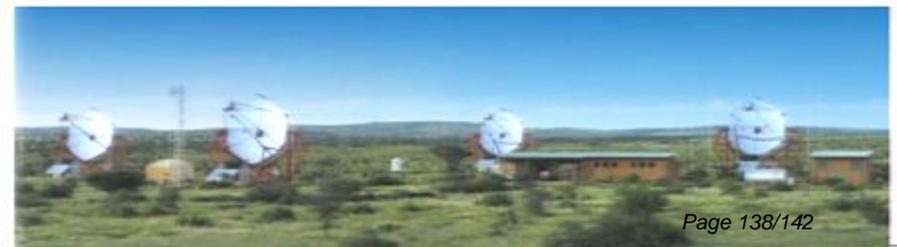

Future observations of electrons

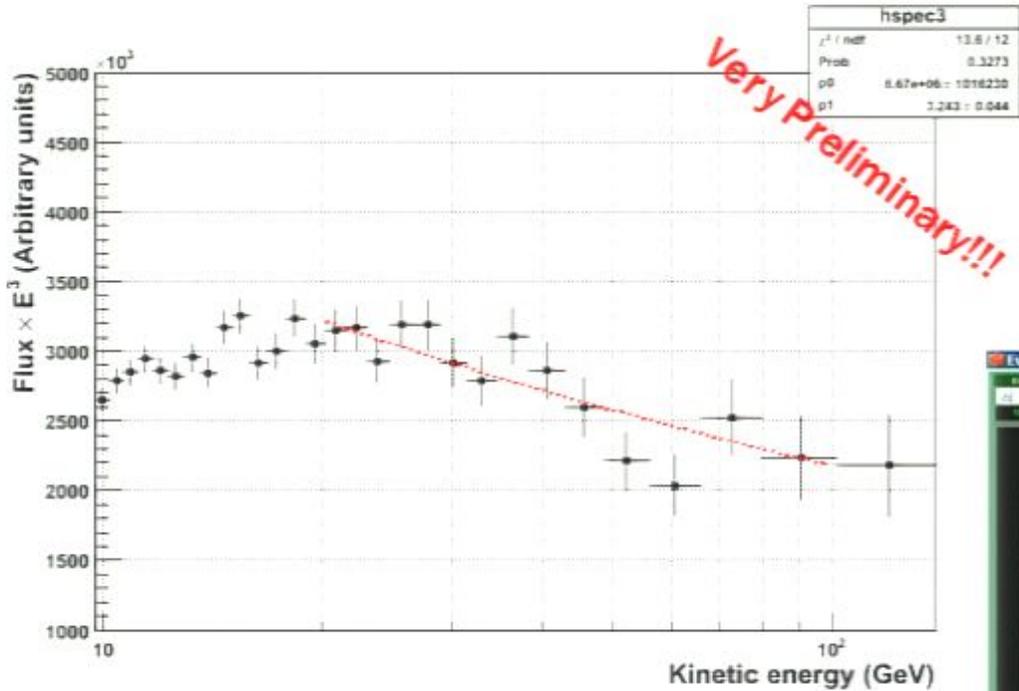

Φ_{e^\pm} up to ~ 1 TeV
 Φ_{e^+} up to ~ 300 GeV
 Φ_{e^-} up to ~ 500 GeV

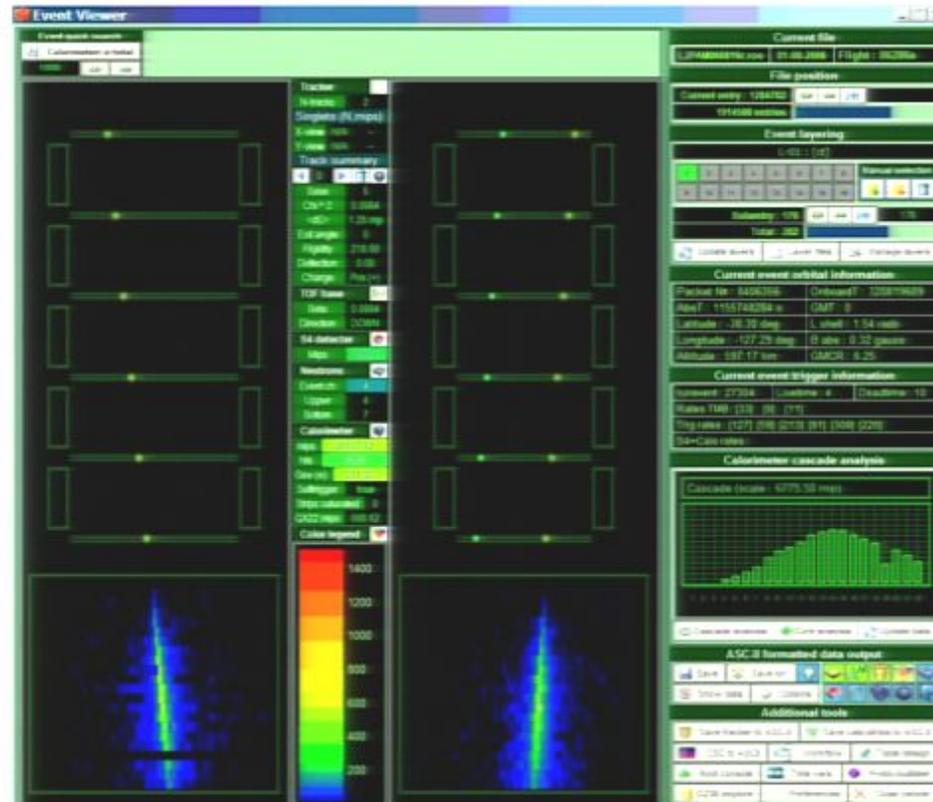

Fermi GST: Φ_{e^\pm} up to ~ 700 GeV

Electron (e^- & e^-+e^+) measurement with PAMELA

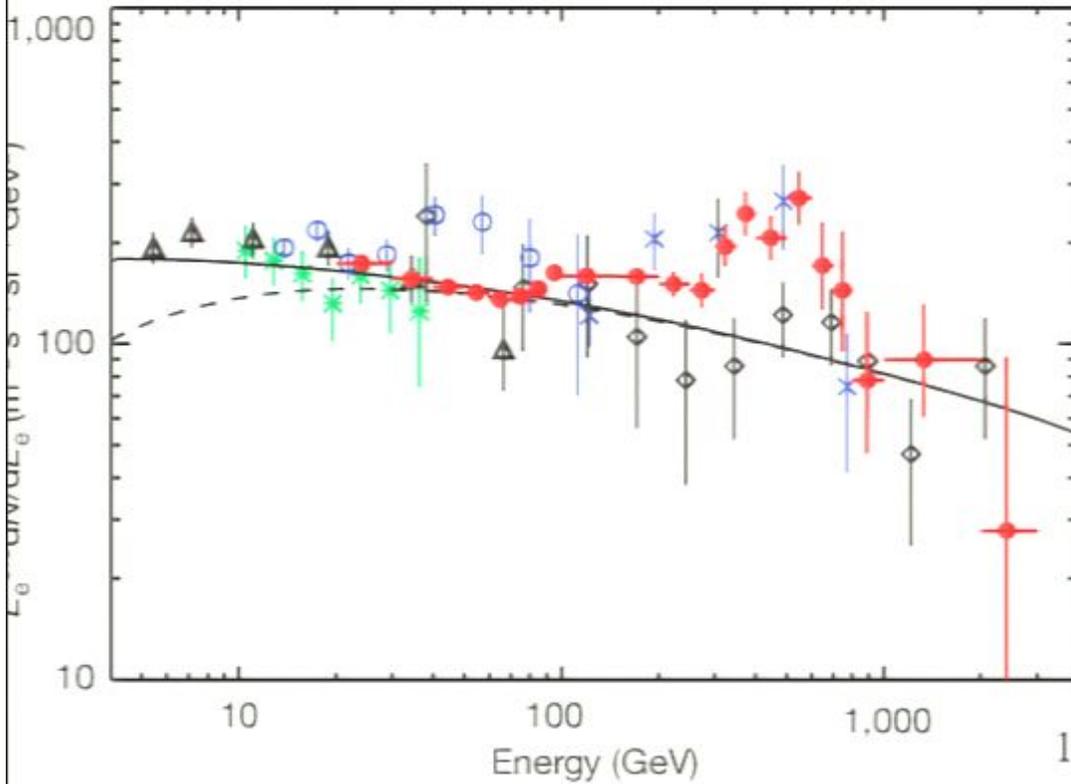

Rig tracker = 219 GV
 Ecalo (pr. long.) = 202 GeV
 Ecalo (det. energy) = 190 GeV
 Neutrons = 4

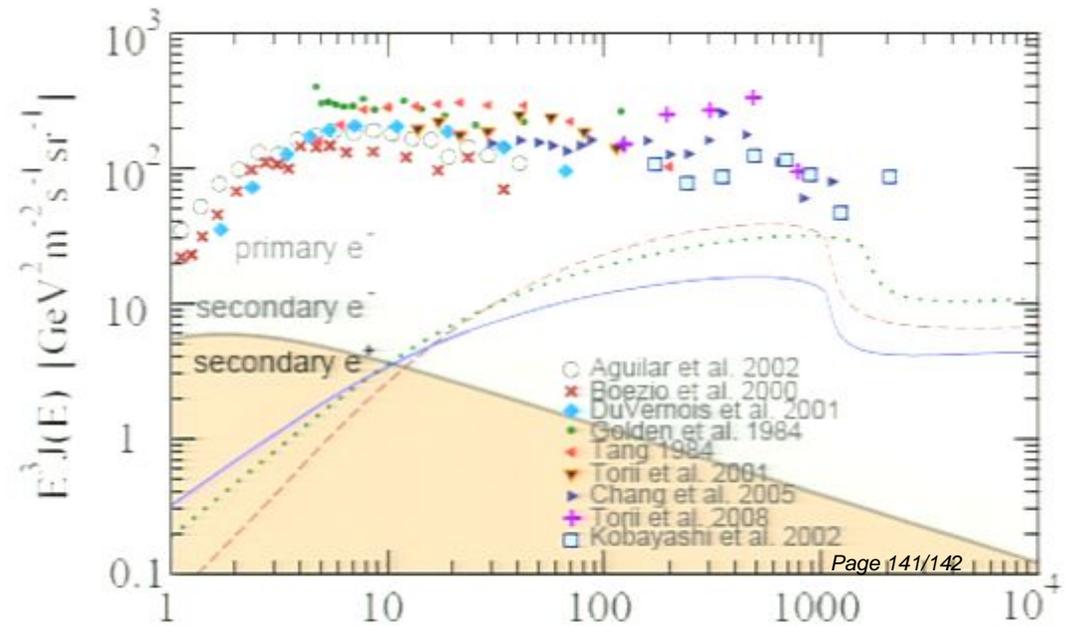

Summary

- PAMELA has been in orbit and studying cosmic rays for ~30 months. $>10^9$ triggers registered, and >10 TB of data has been down-linked.
- **Antiproton-to-proton flux ratio** (~100 MeV - ~100 GeV) shows no significant deviations from secondary production expectations. Additional high energy data in preparation (up to ~150 GeV).
- **High energy positron fraction** (>10 GeV) increases significantly (and unexpectedly!) with energy. Primary source? Data at higher energies will help to resolve origin of rise (spillover limit ~300 GeV).
- Analysis ongoing to measure the **e^- spectrum** up to ~500 GeV, **e^+ spectrum** up to ~300 GeV and **all electrum ($e^- + e^+$) spectrum** up to ~1 TV.
- **Furthemore:**
 - PAMELA is going to provide measurements on elemental spectra and low mass isotopes with an unprecedented statistical precision and is helping to improve the understanding of particle propagation in the interstellar medium
 - PAMELA is able to measure the high energy tail of solar particles.
 - PAMELA is going to set a new lower limit for finding Antihelium
