

Title: Measuring Black Hole Spin

Date: Feb 19, 2009 11:00 AM

URL: <http://pirsa.org/09020045>

Abstract: An astrophysical black hole is completely described with just two parameters: its mass and its dimensionless spin. A few dozen black holes have mass estimates, but until recently none had a reliable spin estimate. The first spins have now been measured for black holes in X-ray binaries.

# ***MEASURING BLACK HOLE SPIN***

Ramesh Narayan

# ***MEASURING BLACK HOLE SPIN***

Ramesh Narayan

# ***A Black Hole is Extremely Simple***

- Mass:  $M$
- Spin:  $a_*$  ( $J = a_* GM^2/c$ )
- Charge:  $Q$  ( $\sim 0$ )

We would like to measure these parameters

# *Measuring Mass is Easy*

## *Spin is Hard*

- Mass can be measured in the **Newtonian limit** using test particles (e.g., stellar companion) at large radii
- Spin has no Newtonian effect
- To measure spin we must be in the regime of strong gravity, where **General Relativity** operates
- Need test particles at small radii
- Fortunately, we have the gas in the accretion disk...

# *Estimating Black Hole Spin*

- X-Ray Continuum Spectrum (**this talk**)
- Relativistically Broadened Iron Line
- Quasi-Periodic Oscillations (?)

# ***Our Team***

**Jeff McClintock**      **Ramesh Narayan**

**Shane Davis, Lijun Gou, Li-Xin Li,**

**Jifeng Liu, Jon McKinney,**

**Jerry Orosz, Mark Reid, Ron Remillard,**

**Rebecca Shafee, Jack Steiner**

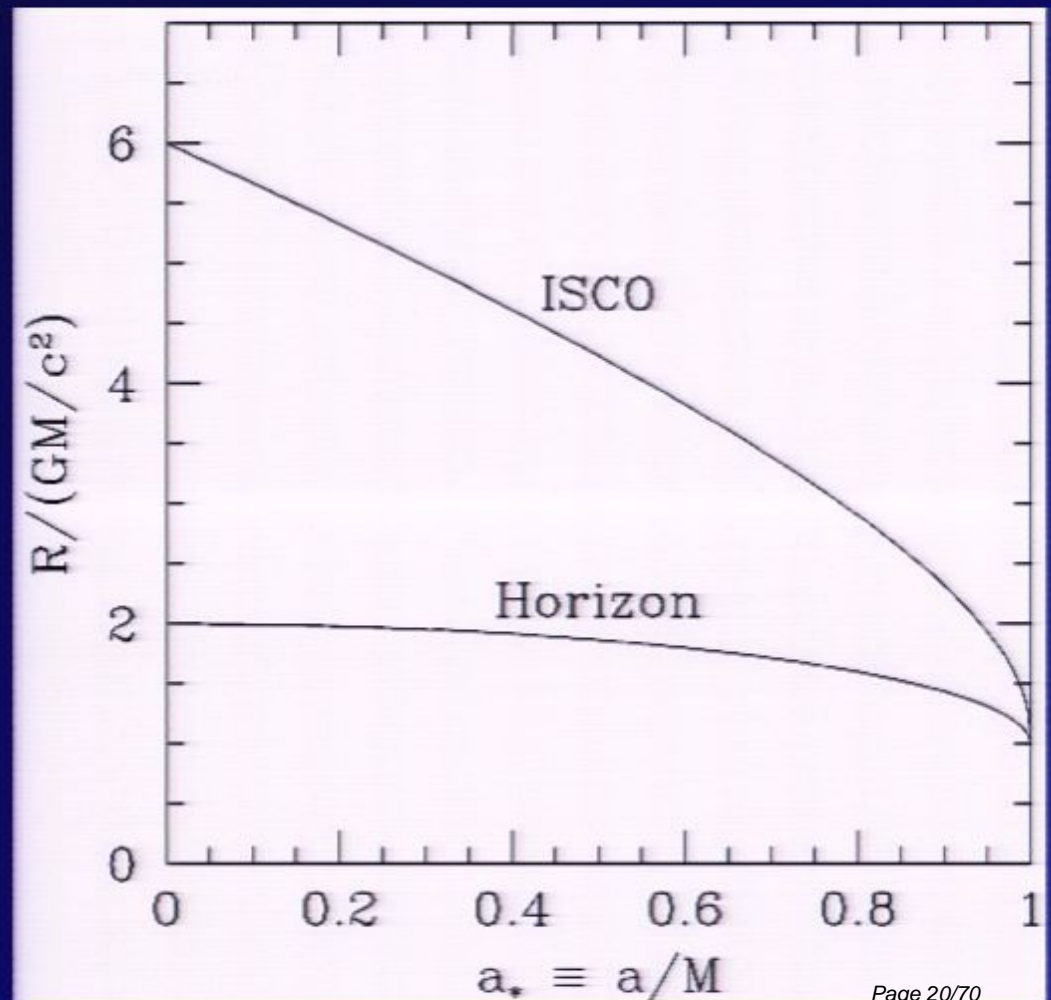

# *Circular Orbits*

- In **Newtonian gravity**, stable circular orbits are available around a point mass at all  **$R$**
- This is no longer true in **General Relativity**
- For a non-spinning **BH (Schwarzschild metric)**, stable orbits allowed only down to  **$R=6M$**
- This is the innermost stable circular orbit, or **ISCO**
- The radius of the **ISCO** ( **$R_{\text{ISCO}}$** ) depends on the **BH spin**

# *Innermost Stable Circular Orbit (ISCO)*

- $R_{\text{ISCO}}/M$  depends on the value of  $a_*$
- If we can measure  $R_{\text{ISCO}}$ , we will obtain  $a_*$
- Note factor of 6 variation in  $R_{\text{ISCO}}$

# *Continuum Method: Basic Idea*

Measure **Radius of the Hole** by estimating the area of the bright inner disk

Zhang et al. (1997); Shafee et al. (2006); Davis et al. (2006); McClintock et al. (2006); Middleton et al. 2006; Liu et al. (2008);...

# Measuring the Radius of a Star

- Measure the flux  $F$  received from the star
- Measure the temperature  $T$  (from spectrum)
- Then, using blackbody radiation theory:

$$L = 4\pi D^2 F = 4\pi R^2 \sigma T^4$$

$$R = \sqrt{\frac{F}{\sigma} \frac{D}{T^2}}$$

- If we know  $F$ ,  $T$  and  $D$ , we directly obtain  $R$

# Measuring the Radius of the Disk Inner Edge

- Here we want the radius of the 'hole' in the disk emission
- Same principle as before
- From  $F_x$ ,  $T_x$  and  $D$ , we get  $R_{\text{ISCO}}$  (some geometrical factors: inclination  $i$ )
- From  $R_{\text{ISCO}}/M$  get  $a_*$
- This is the idea, but in practice need to include many relativistic effects, spectral hardening, etc.

# ***Blackbody-Like Thermal Spectral State***

- BH XRBs are sometimes found in the Thermal State (or High Soft State)
- Soft blackbody-like spectrum, which is consistent with thin disk model
- Only a weak power-law tail
- Perfect for quantitative modeling
- **XSPEC**: diskbb, ezdiskbb, diskpn, **KERRBB, BHSPEC**

# Blackbody-Like Spectral State in BH Accretion Disk

LMC X-3: Beppo-SAX  
(Davis, Done & Blaes 2006)

Up to 10 keV, the only component seen is the disk  
Beyond that, a weak PL tail

- Perfect for estimating inner radius of accretion disk  $\rightarrow$  BH spin
- Just need to estimate  $L_X$ ,  $T_X$  (and  $N_H$ ) from X-ray continuum
- Use full relativistic model (Novikov-Thorne 1973; KERRBB, Li et al. 2005)

# ***Blackbody-Like Thermal Spectral State***

- BH XRBs are sometimes found in the Thermal State (or High Soft State)
- Soft blackbody-like spectrum, which is consistent with thin disk model
- Only a weak power-law tail
- Perfect for quantitative modeling
- **XSPEC**: diskbb, ezdiskbb, diskpn, **KERRBB, BHSPEC**

# Blackbody-Like Spectral State in BH Accretion Disk

LMC X-3: Beppo-SAX  
(Davis, Done & Blaes 2006)

Up to 10 keV, the only component seen is the disk  
Beyond that, a weak PL tail

- Perfect for estimating inner radius of accretion disk → BH spin
- Just need to estimate  $L_X$ ,  $T_X$  (and  $N_H$ ) from X-ray continuum
- Use full relativistic model (Novikov-Thorne 1973; KERRBB, Li et al. 2005)

# Blackbody-Like Spectral State in BH Accretion Disk

LMC X-3: Beppo-SAX  
(Davis, Done & Blaes 2006)

Up to 10 keV, the only component seen is the disk  
Beyond that, a weak PL tail

- Perfect for estimating inner radius of accretion disk → BH spin
- Just need to estimate  $L_X$ ,  $T_X$  (and  $N_H$ ) from X-ray continuum
- Use full relativistic model (Novikov-Thorne 1973; KERRBB, Li et al. 2005)

# Blackbody-Like Spectral State in BH Accretion Disk

LMC X-3: Beppo-SAX  
(Davis, Done & Blaes 2006)

Up to 10 keV, the only component seen is the disk  
Beyond that, a weak PL tail

- Perfect for estimating inner radius of accretion disk → BH spin
- Just need to estimate  $L_X$ ,  $T_X$  (and  $N_H$ ) from X-ray continuum
- Use full relativistic model (Novikov-Thorne 1973; KERRBB, Li et al. 2005)

# ***Blackbody-Like Thermal Spectral State***

- BH XRBs are sometimes found in the Thermal State (or High Soft State)
- Soft blackbody-like spectrum, which is consistent with thin disk model
- Only a weak power-law tail
- Perfect for quantitative modeling
- **XSPEC**: diskbb, ezdiskbb, diskpn, **KERRBB, BHSPEC**

# Blackbody-Like Spectral State in BH Accretion Disk

LMC X-3: Beppo-SAX  
(Davis, Done & Blaes 2006)

Up to 10 keV, the only component seen is the disk  
Beyond that, a weak PL tail

- Perfect for estimating inner radius of accretion disk  $\rightarrow$  BH spin
- Just need to estimate  $L_X$ ,  $T_X$  (and  $N_H$ ) from X-ray continuum
- Use full relativistic model (Novikov-Thorne 1973; KERRBB, Li et al. 2005)

# A Test of the Blackbody Assumption

- For a blackbody,  $L$  scales as  $T^4$  (Stefan-Boltzmann Law)
- BH accretion disks vary a lot in their luminosity
- If a disk is a good blackbody,  $L$  should vary as  $T^4$

Kubota et al. (2002)

McClintock et al. (2008)

$$L = A \sigma T^4$$

■ Looks reasonable

# *Spectral Hardening Factor*

- Disk emission is not a perfect blackbody
- Need to calculate non-blackbody effects through detailed atmosphere model
- True also for measuring radii of stars
- **Davis, Blaes, Hubeny et al.** have developed state-of-the-art models

# A Test of the Blackbody Assumption

- For a blackbody,  $L$  scales as  $T^4$  (Stefan-Boltzmann Law)
- BH accretion disks vary a lot in their luminosity
- If a disk is a good blackbody,  $L$  should vary as  $T^4$

Kubota et al. (2002)

McClintock et al. (2008)

$$L = A \sigma T^4$$

■ Looks reasonable

# *Spectral Hardening Factor*

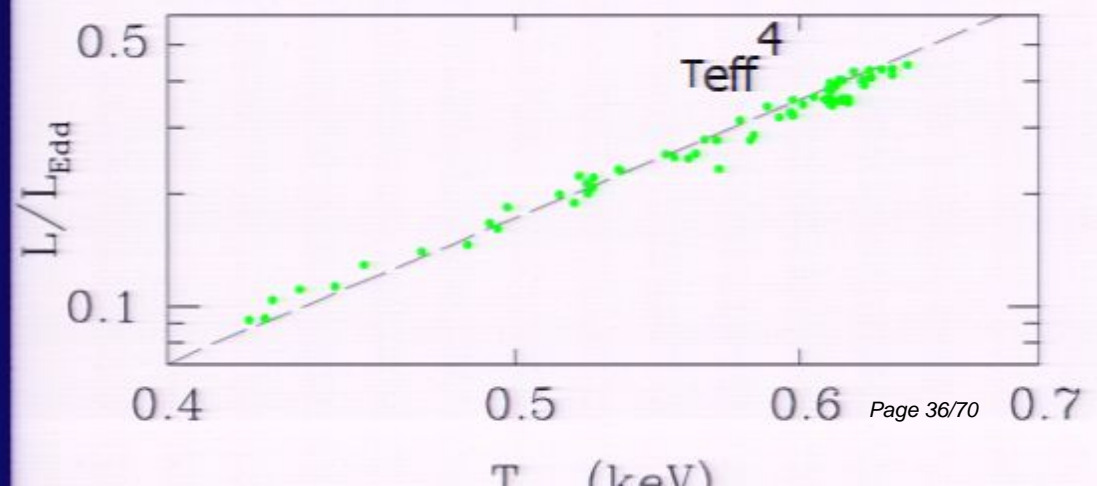

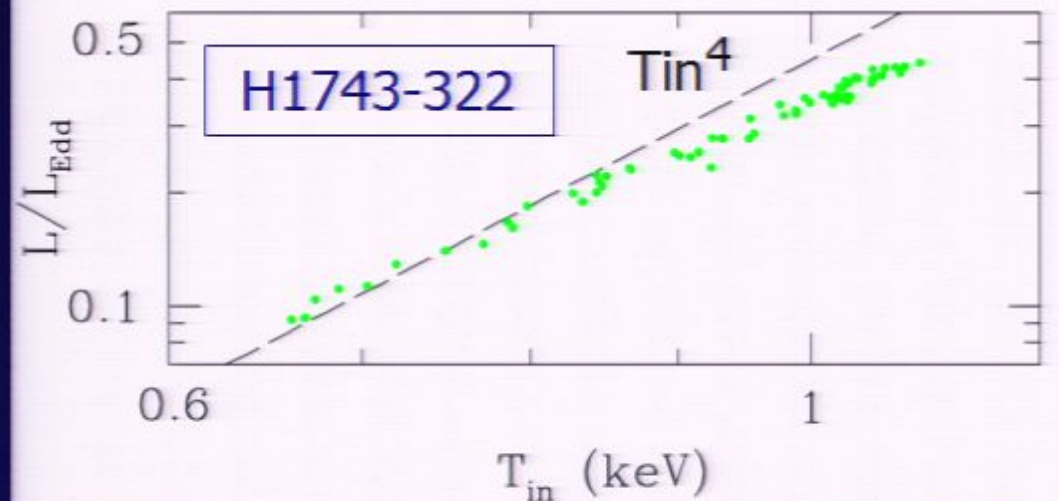

- Disk emission is not a perfect blackbody
- Need to calculate non-blackbody effects through detailed atmosphere model
- True also for measuring radii of stars
- **Davis, Blaes, Hubeny et al.** have developed state-of-the-art models

$$f = T_{\text{col}}/T_{\text{eff}}$$

Davis et al. (2005, 2006)

With color correction  
(from Shane Davis),  
get an excellent  $L-T^4$   
trend

**Conclusion:**  
Thermal State is  
very good for  
quantitative  
modeling  
→ **ISCO**

# M33 X-7: Spin

15 total spectra: 4 "gold" + 11 "silver"

Chandra & XMM-Newton  
Liu et al. (2008)

4 **gold** Chandra spectra

$$a_* = 0.77 \pm 0.02$$

Including uncertainties in  $D$ ,  $i$  &  $M$

$$a_* = 0.77 + 0.05$$

# LMC X-3: Five missions agree!

Further strong evidence for existence of a constant radius!

# M33 X-7: Spin

15 total spectra: 4 "gold" + 11 "silver"

Chandra & XMM-Newton  
Liu et al. (2008)

4 **gold** Chandra spectra

$$a_* = 0.77 \pm 0.02$$

Including uncertainties in  $D$ ,  $i$  &  $M$

$$a_* = 0.77 + 0.05$$

# *Innermost Stable Circular Orbit (ISCO)*

- $R_{\text{ISCO}}/M$  depends on the value of  $a_*$
- If we can measure  $R_{\text{ISCO}}$ , we will obtain  $a_*$
- Note factor of 6 variation in  $R_{\text{ISCO}}$

# *Summary*

- BH mass measurements are routine these days, and they are reliable
- BH spin measurements have finally become feasible, at least for BH XRBs, via the continuum-fitting method
- Reliability of results unclear, but the method generally looks promising
- We may soon be able to study the role of BH spin in generating relativistic jets and other astrophysical phenomena

# *Good News/Bad News*

- Good news:
  - Only need  $F_x, T_x$  from X-ray data
  - Theoretical model is conceptually simple and reliable (just **energy conservation**, no  $\alpha$ )
  - Disk atmosphere fairly well understood
- Bad news:
  - Need accurate  $M, D, i$ : requires a lot of supporting **optical/IR/radio** observations
  - **MHD effects** in the disk unclear/under study
  - Disk inclination not directly measured

# *Robust X-ray Analysis*

- We fit only two parameters –  $a_*$  and  $\dot{M}$  – from the X-ray data (plus the usual  $N_H$ )
- Obtain these from X-ray flux and temperature
- X-ray analysis is thus straightforward & robust
- Significant advantage over other methods

# *Good News/Bad News*

# Disk Inclination

Is BH spin aligned  
with orbit vector?

Are disks warped?

X-ray polarimetry  
can decide

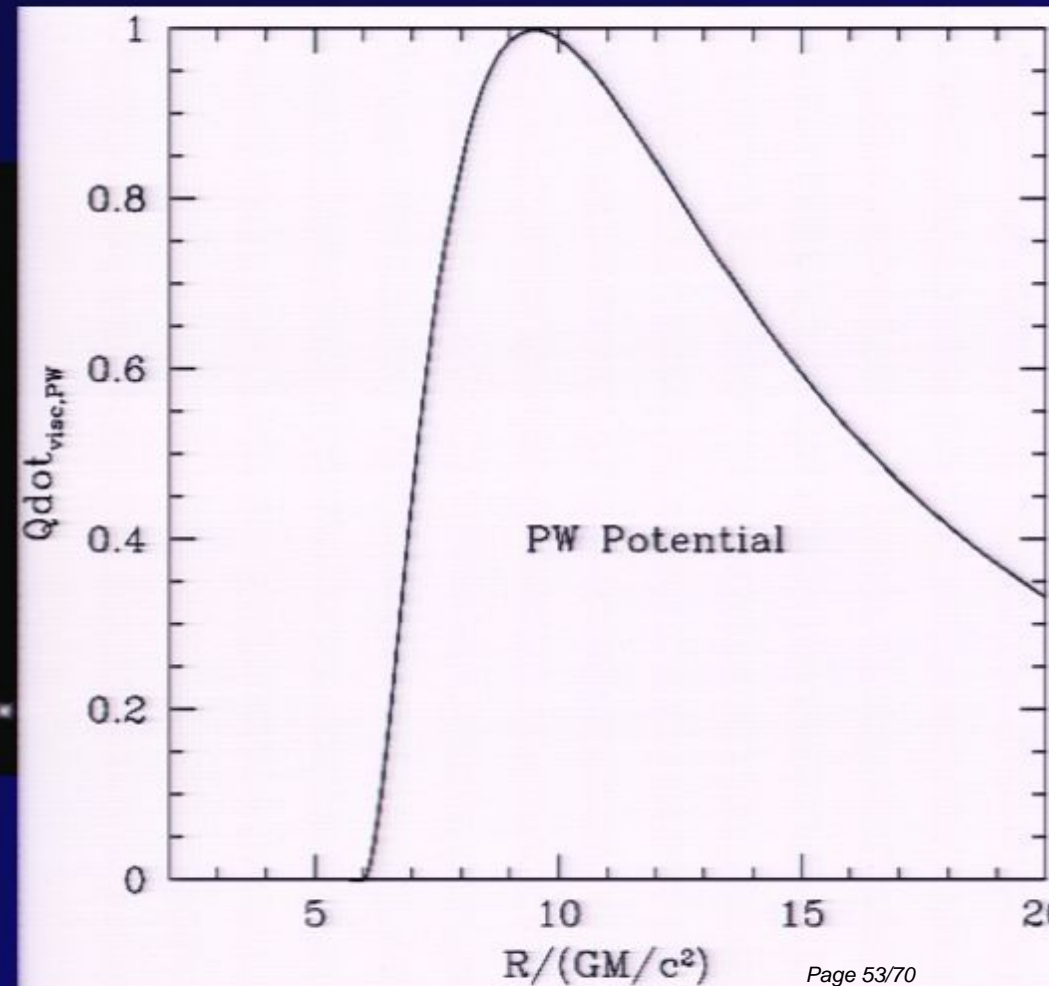

A SMEX polarimeter  
can achieve  $\pm 0.1\%$

Li, Narayan & McClintock (2009)

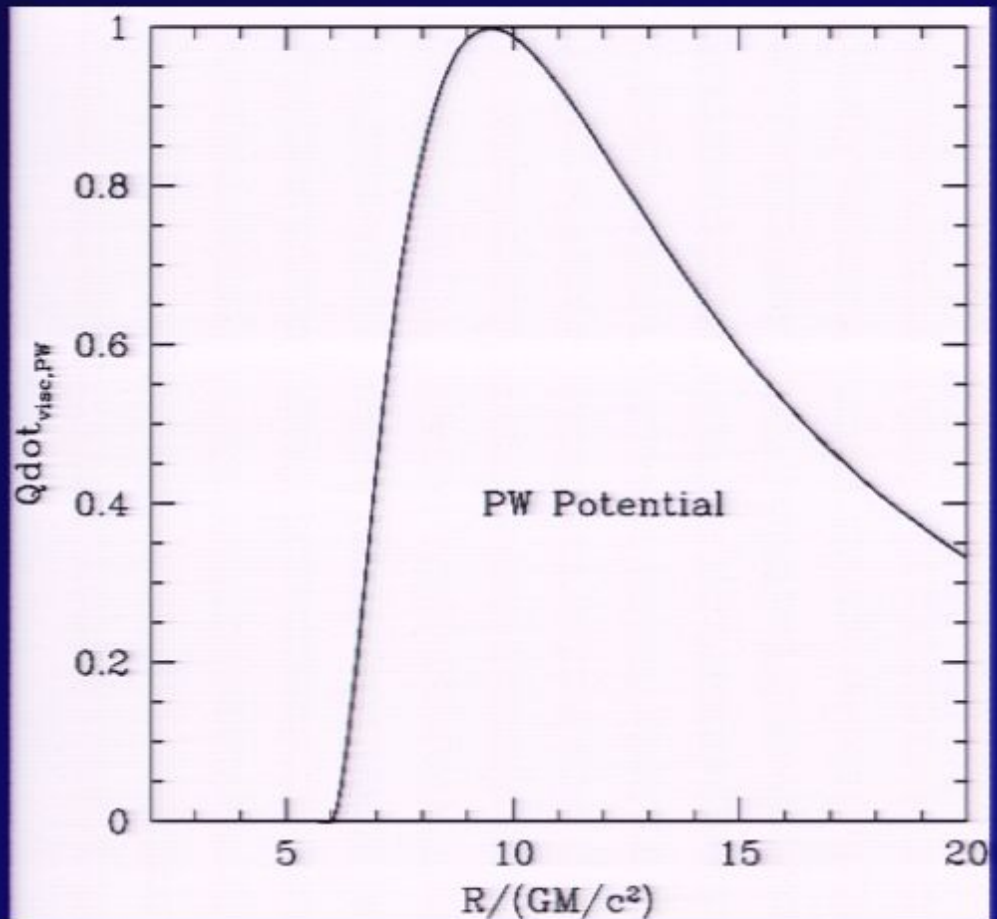

# *How Reliable is the Theoretical Disk Flux Profile?*

# A Major Issue

- The theoretical model assumes that the torque vanishes at the inner edge (ISCO) of the disk (Shakura & Sunyaev 1973)
- But magnetic fields could produce significant torque at and inside the ISCO (Krolik 1999; Gammie 1999)
- Afshordi & Paczynski (2003) say this effect is not important for a thin disk
- **Is this really true?**

# *Check: Hydrodynamic Model*

- Steady hydrodynamic disk model with  $\alpha$ -viscosity
- Make no assumption about the torque at the ISCO – solve for it self-consistently
- Goal: Find out if standard model is OK  
(Shafee et al. 2008a)

# Torque vs Disk Thickness

For  $H/R < 0.1$ , good agreement with idealized thin disk model (i.e., we confirm results of Afshordi & Paczynski 2003)

Result is insensitive to the value of  $\alpha$

# *Check: Hydrodynamic Model*

- Steady hydrodynamic disk model with  $\alpha$ -viscosity
- Make no assumption about the torque at the ISCO – solve for it self-consistently
- Goal: Find out if standard model is OK  
(Shafee et al. 2008a)

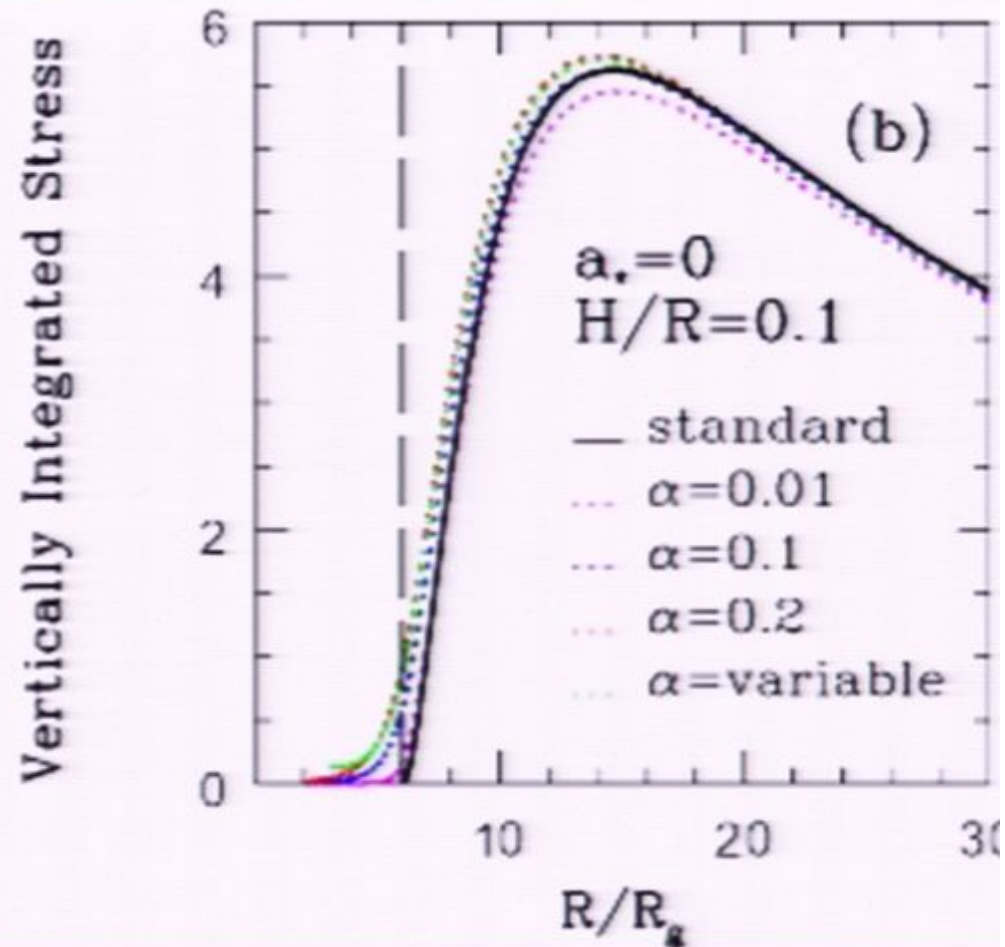

# A Major Issue

- The theoretical model assumes that the torque vanishes at the inner edge (ISCO) of the disk (Shakura & Sunyaev 1973)
- But magnetic fields could produce significant torque at and inside the ISCO (Krolik 1999; Gammie 1999)
- Afshordi & Paczynski (2003) say this effect is not important for a thin disk
- **Is this really true?**

# Torque vs Disk Thickness

For  $H/R < 0.1$ , good agreement with idealized thin disk model (i.e., we confirm results of Afshordi & Paczynski 2003)

Result is insensitive to the value of  $\alpha$

# *Caveat*

- The results just described are based on a hydrodynamic disk model with  $\alpha$ -viscosity
- But 'viscosity' in an accretion disk is from magnetic fields via the MRI
- Therefore, we should do multi-dimensional MHD simulations, and
  - Directly check magnetic stress profile
  - Check viscous energy dissipation profile

# *3D GRMHD Simulation of a Thin Accretion Disk*

- Shafee et al. (2008b)
- $512 \times 128 \times 32$  grid
- Self-consistent MHD simulation
- All GR effects included
- $h/r \sim 0.05 - 0.1$  (thin!!)
- Very few other thin disk simulations: Reynolds & Fabian (2008); Noble, Krolik & Hawley (2009)

512x128x32

512x128x32

# 3D GRMHD Simulation Results

Angular momentum profile from the 3D simulations is very close to that of the idealized Novikov-Thorne model (within 2%)

Very little torque at the ISCO ( $\sim 2\%$ )

Dissipation profile  $F(r)$  is still uncertain, but probably  $\sim 5\%$  error in  $a_*$

(Shafee et al. 2008b)

# 3D GRMHD Simulation Results

Angular momentum profile from the 3D simulations is very close to that of the idealized Novikov-Thorne model (within 2%)

Very little torque at the ISCO ( $\sim 2\%$ )

Dissipation profile  $F(r)$  is still uncertain, but probably  $\sim 5\%$  error in  $a_*$

(Shafee et al. 2008b)

## ***Bottom Line***

- We are reasonably optimistic that the **spin estimates** obtained from fitting continuum X-ray spectra of **BH XRBs** are believable, provided disk is thin
- Of course, much more **MHD simulation work** is needed
- Plus plenty of hard **Observational work**

# *Spinning Black Hole as an Energy Source*

- A spinning BH has free energy -- behaves like a flywheel
- Can we “grip” the BH and access the free energy?!
- Can be done with specially designed particles (Penrose 1969), but this scenario is unlikely to take place naturally
- Magnetic fields are more promising: Magnetic Penrose Process
- Are relativistic jets related to BH spin?

# ***BH Masses and Spins***

<b>Source Name</b>	<b>BH Mass (<math>M_{\odot}</math>)</b>	<b>BH Spin (<math>a_*</math>)</b>
<b>LMC X-3</b>	<b>5.9—9.2</b>	<b><math>\sim 0.25</math></b>
<b>XTE J1550-564 (J)</b>	<b>8.4—10.8</b>	<b>(<math>\sim 0.5</math>)</b>
<b>GRO J1655-40 (J)</b>	<b>6.0—6.6</b>	<b>0.65—0.80</b>
<b>M33 X-7</b>	<b>14.2—17.1</b>	<b><math>0.77 \pm 0.05</math></b>
<b>4U1543-47</b>	<b>7.4—11.4</b>	<b>0.7—0.85</b>
<b>LMC X-1</b>	<b>9.0—11.6</b>	<b>0.81—0.94</b>
<b>GRS 1915+105 (J)</b>	<b>10—18</b>	<b>0.98—1</b>

## *Other Methods*

- The **iron line** method is being applied to a few **BH XRBs**
- It is important to check and compare the two methods on the same **BH XRBs**
- Vital if we wish to measure spins of **supermassives BHs**, where only the **iron line** method is feasible

# *Summary*

- BH mass measurements are routine these days, and they are reliable
- BH spin measurements have finally become feasible, at least for BH XRBs, via the continuum-fitting method
- Reliability of results unclear, but the method generally looks promising
- We may soon be able to study the role of BH spin in generating relativistic jets and other astrophysical phenomena
