

Title: Beyond the Standard (cosmological) Model

Date: Sep 09, 2009 02:00 PM

URL: <http://pirsa.org/09090030>

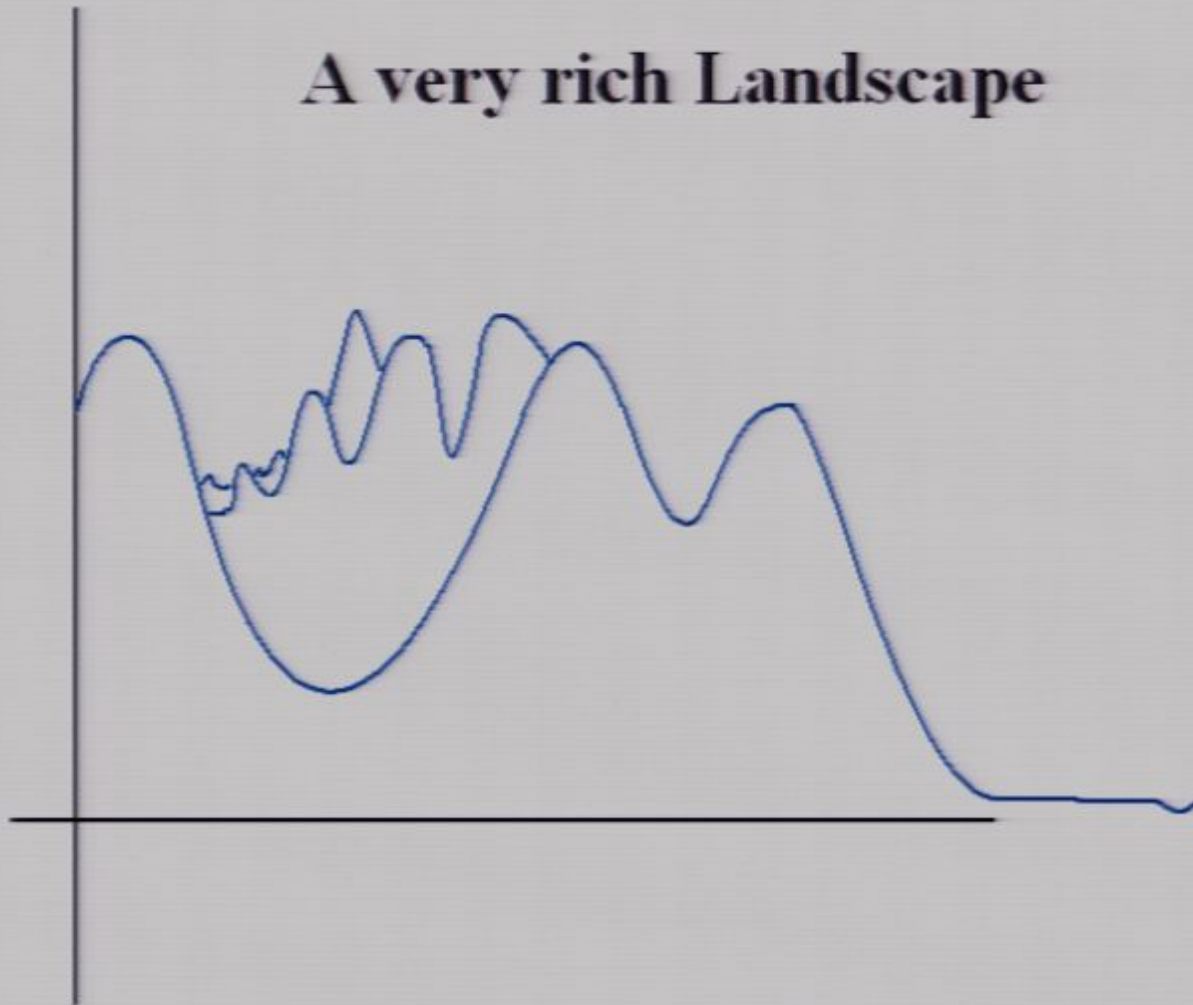

Abstract: The Standard model of Cosmology consists of a package of ideas that include Cold Dark Matter, Inflation, and the existence of a small Cosmological Constant. While there is no consensus about what lies beyond the Standard Model, there is a leading candidate that also includes a small package of ideas: A Landscape of connected vacua: the idea that the universe started out with a large energy density, and Coleman DeLuccia Tunneling between vacua. An additional idea that comes from string theory and black hole physics is the Holographic Principle. I will explain how the various ingredients for a "post-standard-model" standard model fit together.

Beyond the Standard Model (Λ , CDM, I) ?

Why do ~~we~~ I think there is anything beyond the SM?

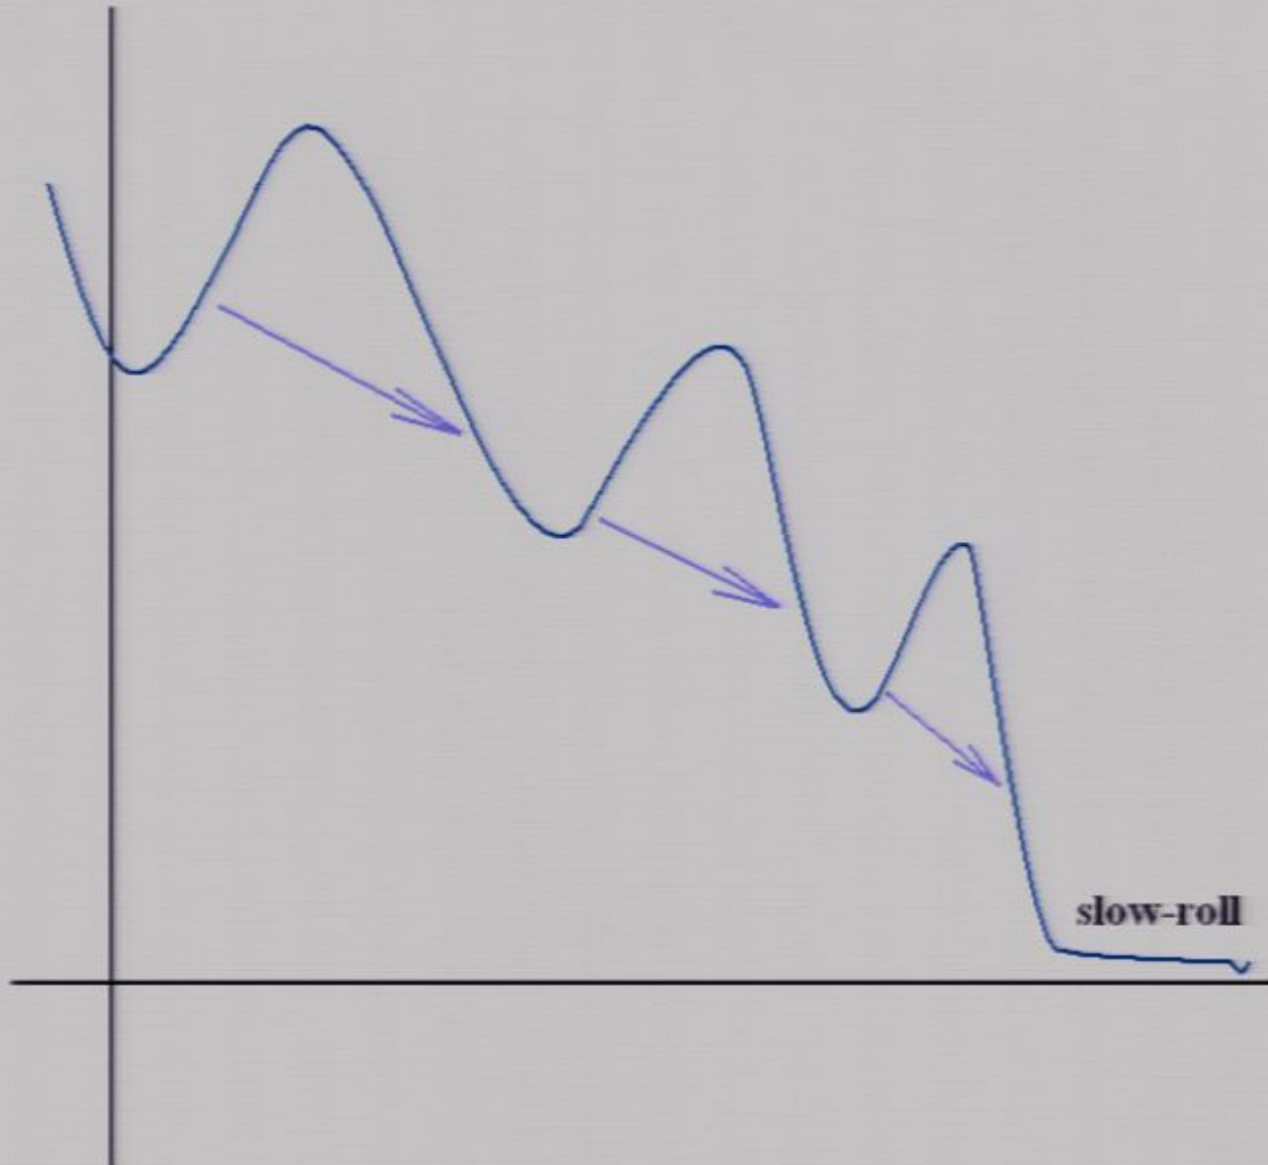

A very rich Landscape

Series or parallel?

Series or parallel?

Series or parallel?

A

A positive CC is a form of long range repulsion.

If the CC were much larger than it is (10^{-123}) structure formation would have been impossible.

Why slow-roll inflation?

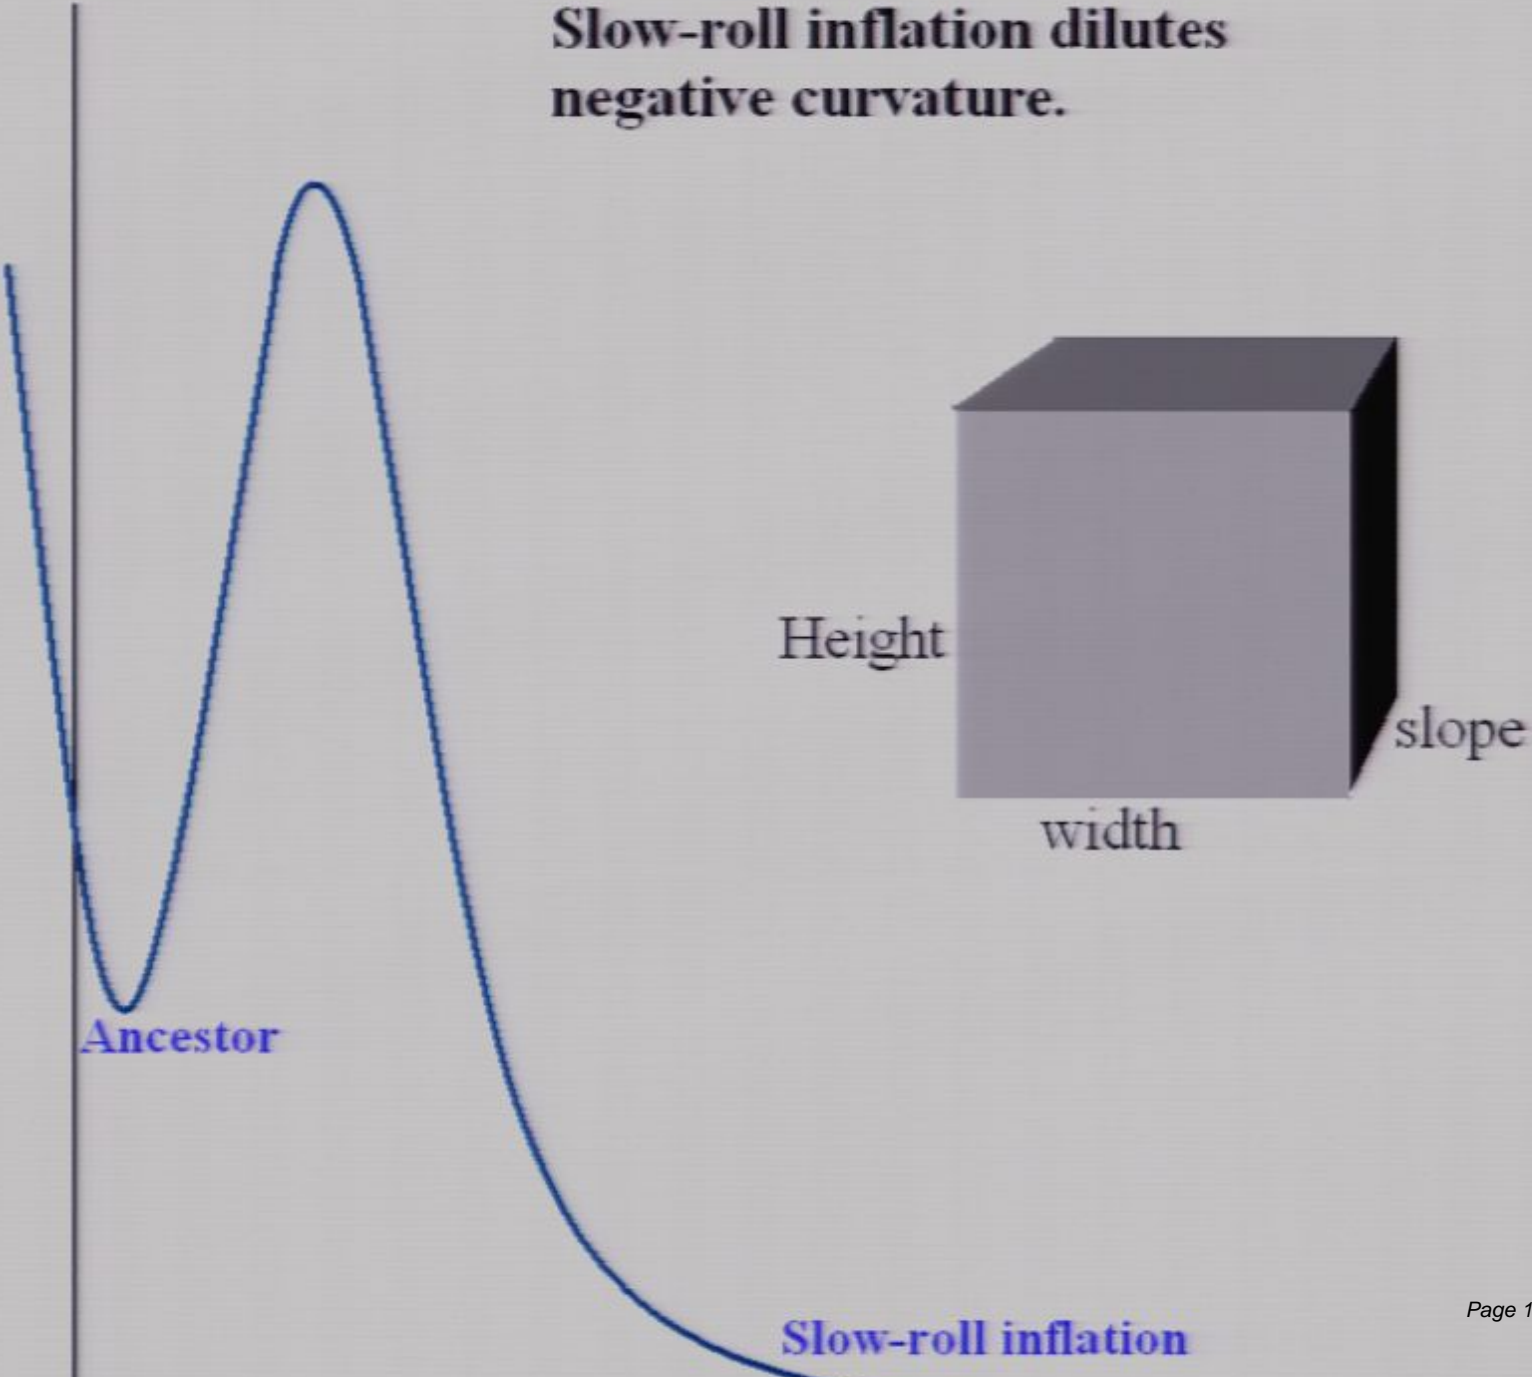

The interior of bubbles are negatively-curved, open, infinite, FRW universes.

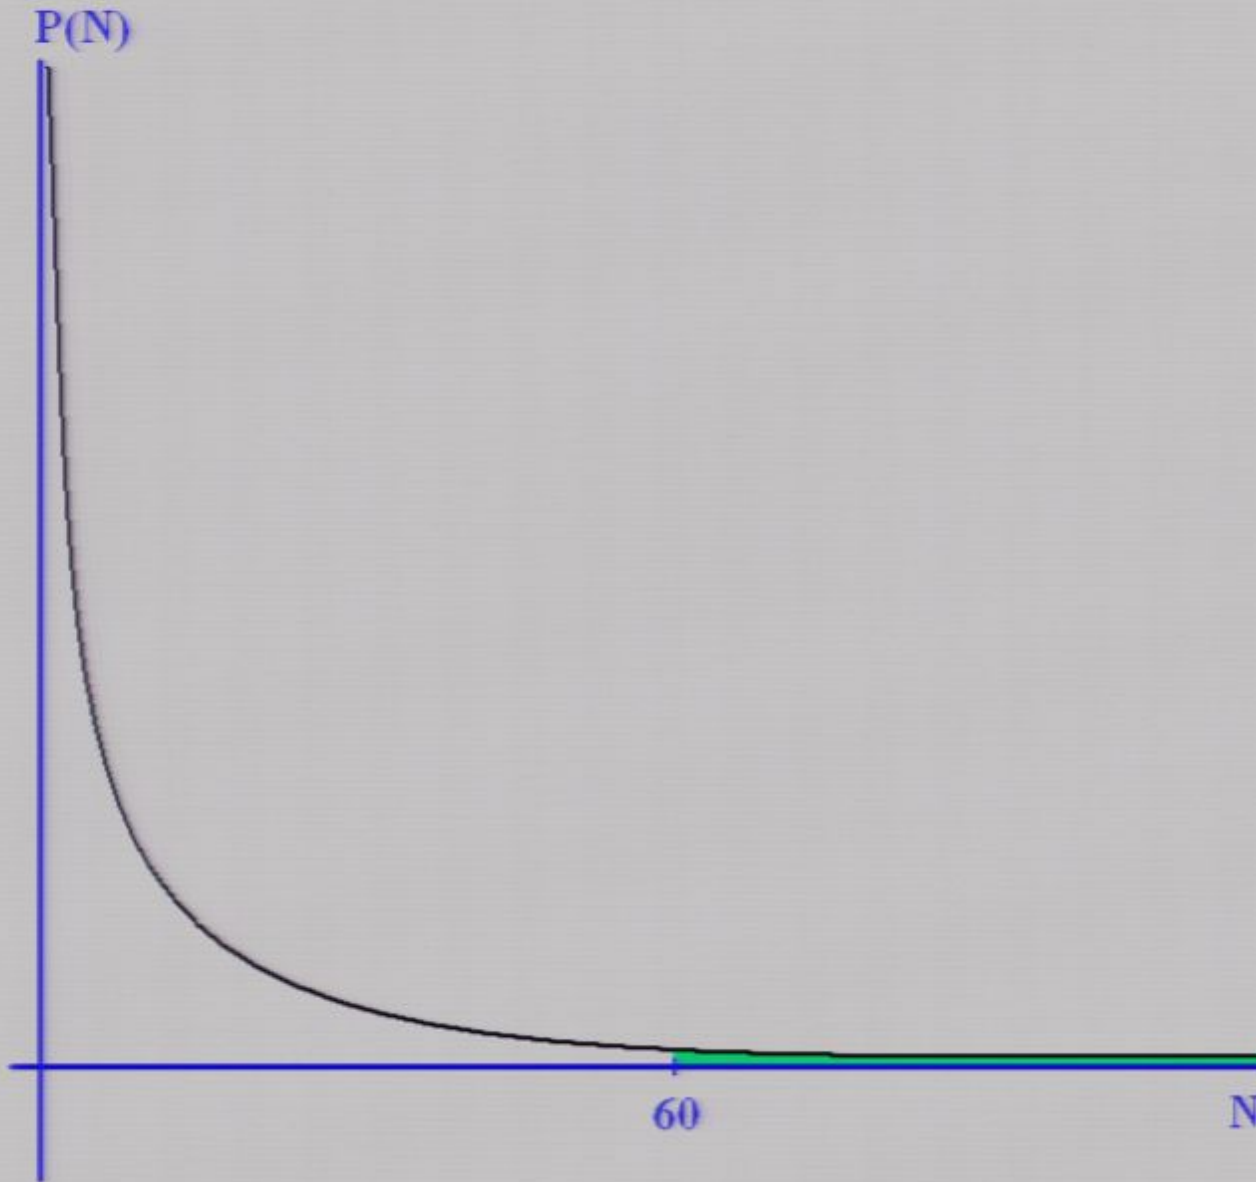

Negative curvature means everything is moving with $>$ escape velocity.

Too much negative curvature will prevent structure formation.

Slow-roll inflation dilutes negative curvature.

$$P(N > 60) \sim 10^{-12}$$

$$P(N > 60 | N > 57.5) \sim .9$$

Slow-roll inflation dilutes negative curvature.

$$P(N > 60 | N > 57.5) \sim .9$$

$P \sim .1$

Direct Observation?

- Curvature 
- Bubble collisions with our bubble
- Axion signals
- Tensor modes

Spatial Curvature

Tradition suggests positive curvature.

Eternal inflation + bubble nucleation requires
negative curvature!

Negative

$$N_e = 61$$

$$N_e = 64$$
