

Title: Classification of topological insulators and superconductors

Date: Oct 07, 2009 12:00 PM

URL: <http://pirsa.org/09100140>

Abstract: Complete classification of topological insulators (including, e.g., the quantum Hall effect and the quantum spin Hall systems), and superconductors (including, e.g., chiral p-wave SC and the B-phase of ^3He). An interacting bosonic model that realizes a topological superconducting phase in three spatial dimensions.

quantum condensed matter systems: classification of topological states and entanglement scaling

Shinsei Ryu
Univ. of California, Berkeley

phases and phase transitions in condensed matter systems

classical phases

Ginzberg-Laudau theory
Nambu-Goldstone modes

quantum phases

gapless phases

- Fermi liquid
- non Fermi liquid

gapped phases

- insulators
- topological insulators
- topological superconductors
- topological phase

quantum critical points

- relativistic conformal quantum critical point

quantum many-body physics beyond Landau-Ginzberg paradigm

- is it possible to have an exhaustive classification of quantum phases in many-body systems ?
- what is a good "order parameter" to distinguish all these phases ?

table of contents

- classification of topological insulators/superconductors
- example of interacting superconductor
- entanglement entropy in topological insulators/SCs
- holographic calculation of entanglement entropy

quantum many-body physics beyond Landau-Ginzberg paradigm

chiral p-wave SC in d=2 - a topological SC

topological SC = BdG quasi-particles are topologically non-trivial

$$H = \frac{1}{2} \int \Psi^\dagger \begin{pmatrix} \xi & \Delta \\ -\Delta^* & -\xi^T \end{pmatrix} \Psi$$

$$\Psi^\dagger = (\psi^\dagger, \psi) \quad \text{or} \quad (\psi_\uparrow^\dagger, \psi_\downarrow^\dagger, \psi_\uparrow, \psi_\downarrow) \quad \text{etc.}$$

px + i py SC order parameter:

$$\Delta(k) = |\Delta| (k_x + ik_y)$$

$$\Delta(k) = |\Delta| \hat{z} (k_x + ik_y)$$

$$\xi(k) = \frac{k^2}{2m} - \mu$$

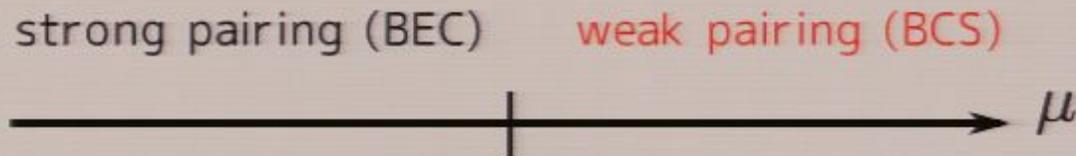

Read-Green (2000)

strong pairing (BEC)

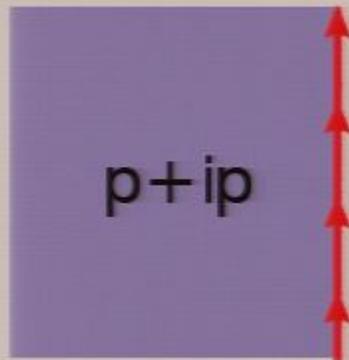

weak pairing (BCS)

chiral p-wave SC in d=2 - a topological SC

stable boundary Majorana-Weyl fermion in the weak pairing phase

vac.

$$S = \int dx d\tau \bar{\psi} \partial \psi$$

quantized thermal Hall conductivity

with inclusion of the dynamics of Cooper pair:

non-trivial ground state degeneracy topologically protected q-bit

non-Abelian statistics of vortices

vortex supports an isolated Majorana mode

chiral p-wave SC in d=2 - a topological SC

topological SC = BdG quasi-particles are topologically non-trivial

$$H = \frac{1}{2} \int \Psi^\dagger \begin{pmatrix} \xi & \Delta \\ -\Delta^* & -\xi^T \end{pmatrix} \Psi$$

$$\Psi^\dagger = (\psi^\dagger, \psi) \quad \text{or} \quad (\psi_\uparrow^\dagger, \psi_\downarrow^\dagger, \psi_\uparrow, \psi_\downarrow) \quad \text{etc.}$$

\mathbb{Z} integer classification

\mathbb{Z}_2 Z2 classification

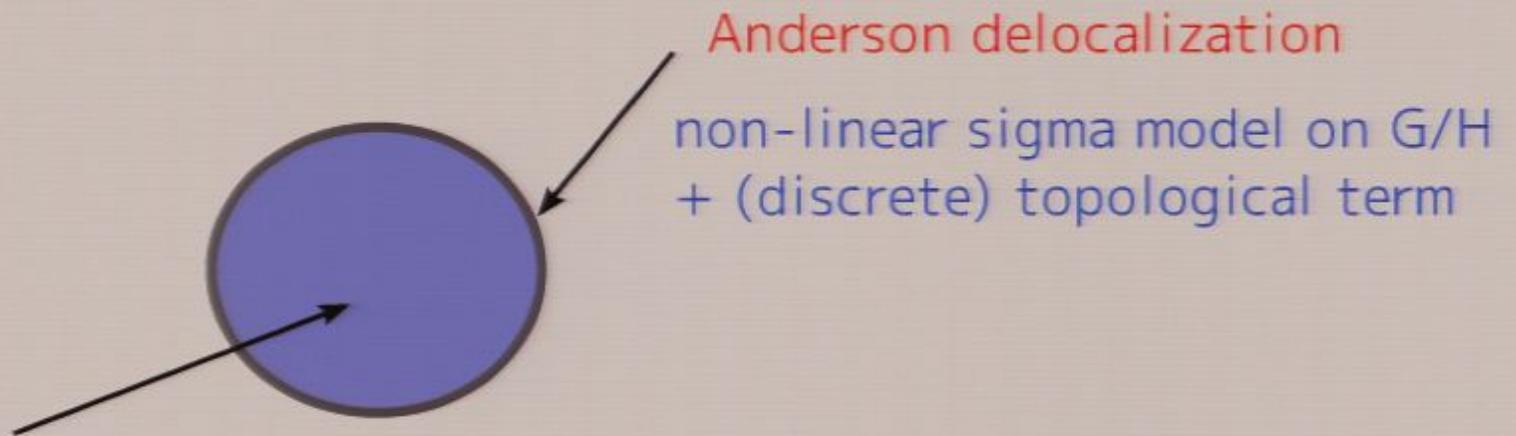

0 no top. ins./SC

underlying strategies for classification

- discover a topological invariant

- bulk-boundary correspondence

bulk-boundary correspondence

topological insulators/SC

fully gapped,
no excitations

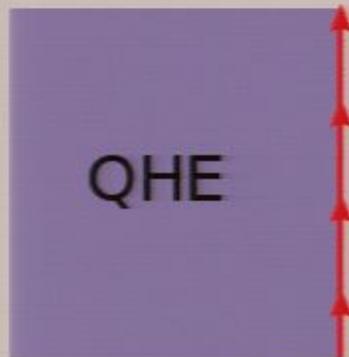

Anderson delocalization

non-linear sigma model on G/H
+ (discrete) topological term

IQHE

QSHE

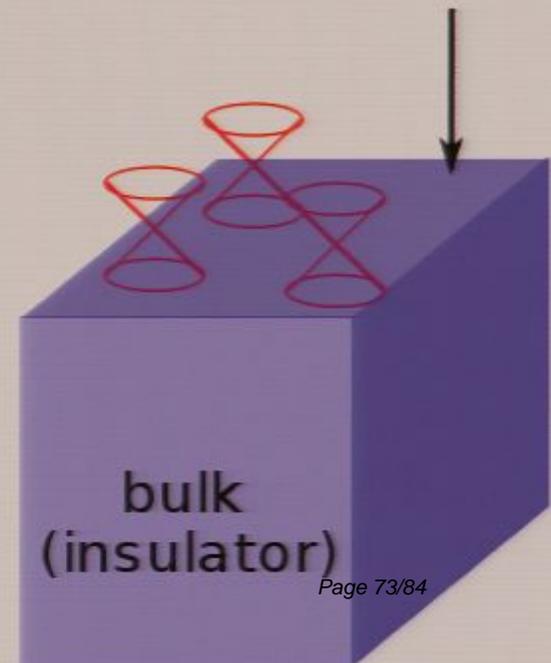

chiral $p+ip$ wave SC

QHE

vac

surface

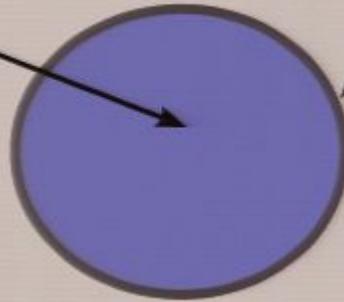

case study: Z_2 topological insulator in $d=3$

bulk-boundary correspondence

topological insulators/SC

fully gapped,
no excitations

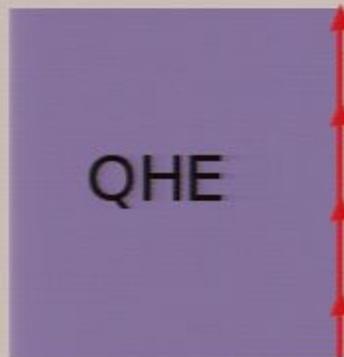

Anderson delocalization

non-linear sigma model on G/H
+ (discrete) topological term

IQHE

QSHE

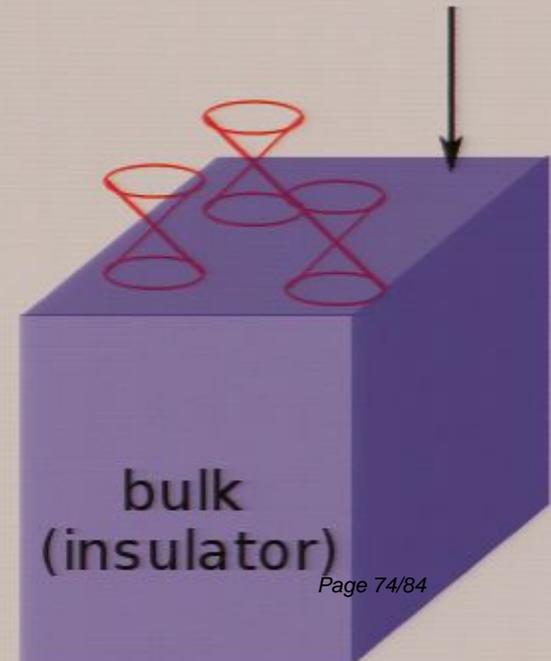

chiral $p+ip$ wave SC

QHE

vac

surface

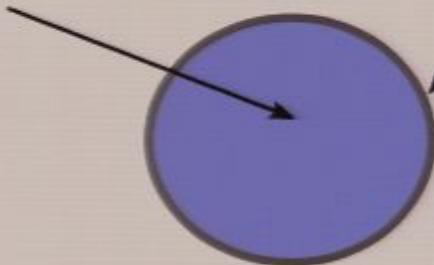

bulk
(insulator)

case study: \mathbb{Z}_2 topological insulator in $d=3$

bulk-boundary correspondence

topological insulators/SC

fully gapped,
no excitations

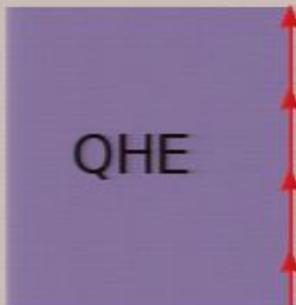

Anderson delocalization

non-linear sigma model on G/H
+ (discrete) topological term

IQHE

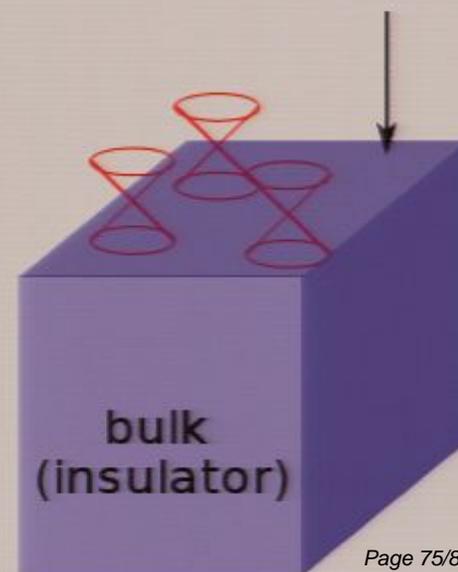

QSHE

chiral p+ip wave SC

vac

surface

case study: Z_2 topological insulator in $d=3$

Z2 topological term in symplectic symmetry class

SR, Obuse, Mudry, Furusaki (07)

microscopic model:

$$\mathcal{H} = v_F (\sigma_x p_x + \sigma_y p_y) + V(\mathbf{r}) \quad i\sigma_y \mathcal{H}^* (-i\sigma_y) = \mathcal{H}$$

effective field theory: non-linear sigma model

$$Q(\mathbf{r}) \in O(4N)/[O(2N) \times O(2N)] \quad (\text{diffusive motion of electrons})$$

$$S = \sigma_{xx} \int d^2 r \operatorname{tr} [\partial_\mu Q \partial_\mu Q]$$

even number of Dirac

$$Z = \int \mathcal{D}[Q] e^{-S}$$

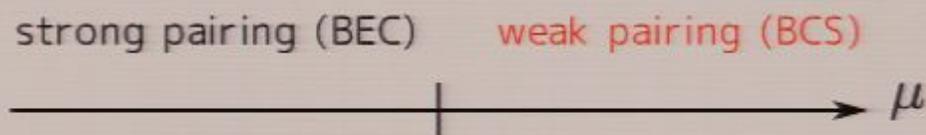

odd number of Dirac
-> Z2 topological term

$$Z = \int \mathcal{D}[Q] (-1)^{n[Q]} e^{-S} \quad n[Q] = 0, 1$$

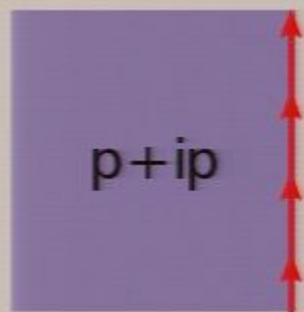

classification of topological insulators and superconductors

- integer quantum Hall effect
- quantum spin Hall effect
- topological superconductor
- classification of topological insulators and SCs

chiral p-wave SC in d=2 - a topological SC

stable boundary Majorana-Weyl fermion in the weak pairing phase

vac.

$$S = \int dx d\tau \bar{\psi} \partial \psi$$

quantized thermal Hall conductivity

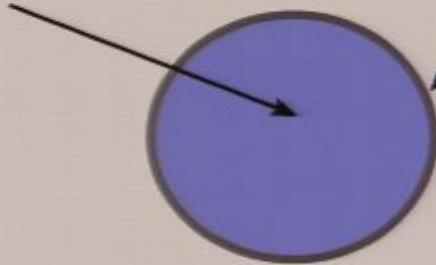

with inclusion of the dynamics of Cooper pair:

- non-trivial ground state degeneracy topologically protected q-bit
- non-Abelian statistics of vortices
- vortex supports an isolated Majorana mode

bulk-boundary correspondence

topological insulators/SC

fully gapped,
no excitations

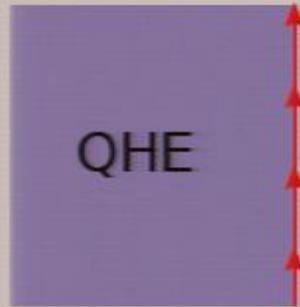

Anderson delocalization

non-linear sigma model on G/H
+ (discrete) topological term

IQHE

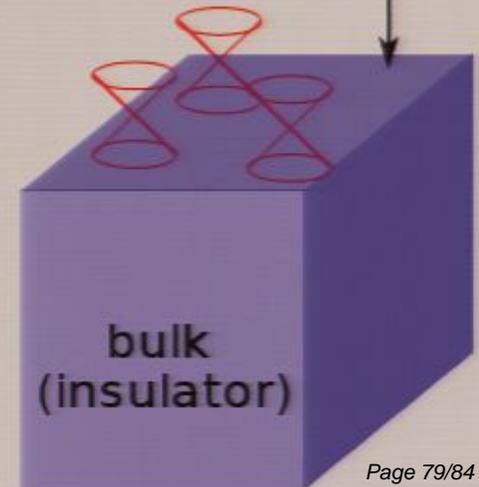

QSHE

chiral p+ip wave SC

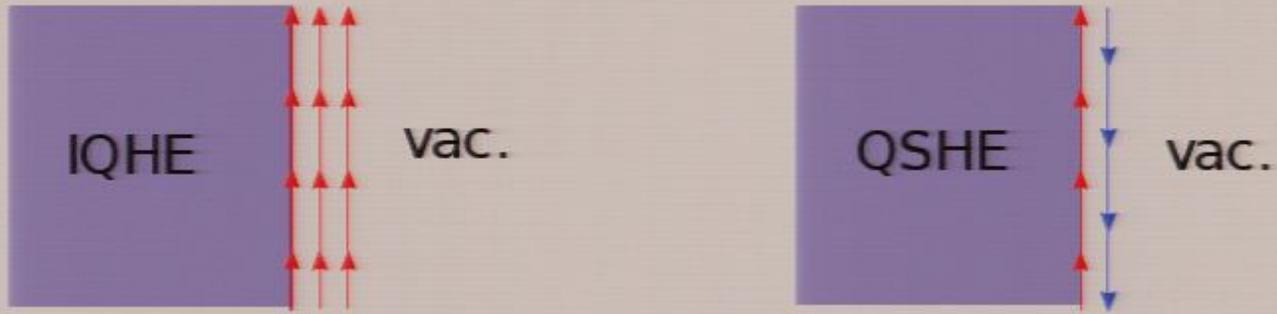

vac

surface

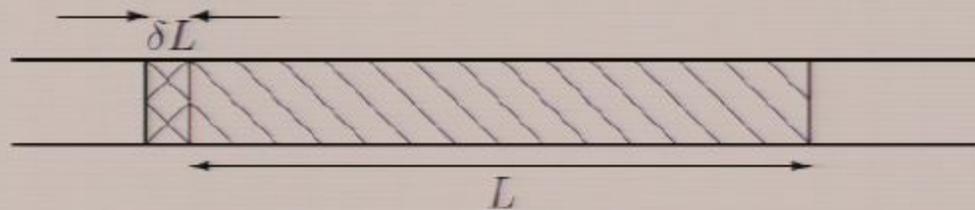

case study: Z_2 topological insulator in $d=3$

classification in (2+1)-dimensions

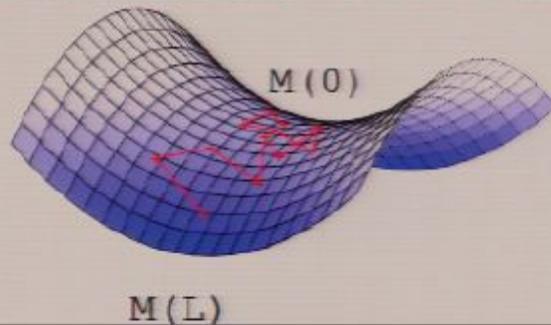

classification of (1+1)-dimensional Anderson delocalization

$$\mathcal{M}_E(L + \delta L) = \mathcal{M}_E(\delta L)\mathcal{M}_E(L)$$

⇒ “Brownian motion” of the transfer matrix
