

Title: Gravitational Wave Detection: Past, Present and Future

Date: Jun 26, 2010 09:00 AM

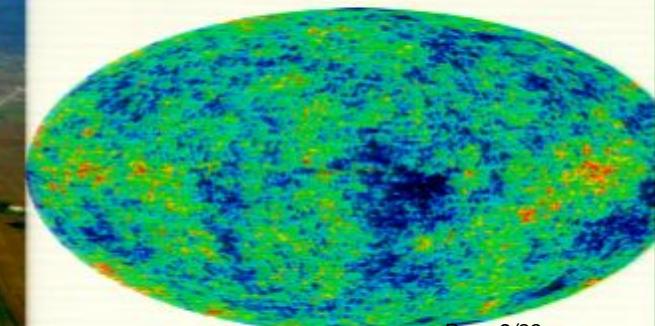

URL: <http://pirsa.org/10060082>

Abstract: Direct detection of gravitational wave stands at a cross roads; the first generation of interferometric detectors will soon be decommissioned and the second generation projects are underway. In this talk, I will describe the Initial LIGO and VIRGO generation of instruments, the techniques required to achieve a strain sensitivity of 3×10^{-23} and an NS / NS inspiral range of 15 Mpc. I'll follow with a description of the Advanced detectors and the differences that should improve the sensitivity by a factor of ten. Finally, I will describe projects from radio and microwave astronomy to measure gravitational waves using pulsar timing and the CMB B-mode polarization.

Satellite to Satellite Interferometry

	LISA	Laser interferometer SST (preliminary)
Inter-satellite distance	5 million km	\approx 200 km
Orbit	Heliocentric (1 a.u., triangular constellation)	LEO (\approx 400 km, Pendulum configuration)
Orbit environment	No atmospheric drag, stable thermal environment	Atmospheric drag, large thermal disturbances
Attitude and Orbit Control System	Drag-free	Partial drag compensation (?)
Single-link noise	12 pm/ $\sqrt{\text{Hz}}$ (\times freq. dep.)	\approx 50 nm/ $\sqrt{\text{Hz}}$ (\times freq. dep.)
Telescope aperture	38 cm	1.5 cm
Transmit power	1 W	0.03 W
Received power (at telescope)	360 pW	2000 pW
Phase measurement bandwidth	20 MHz	40 MHz

- Users want continued data and better data
- Several constellations under intensive discussions, nothing decided yet
- Best value from Sat-Sat ranging (GRACE concept) with
 - Laser interferometer: $2 \mu\text{m}/\sqrt{\text{Hz}} \rightarrow 50 \text{ nm}/\sqrt{\text{Hz}}$ or better
 - Pendulum orbit helps aliasing problem
 - More than one pair also helps
- GRACE-C : Grace copy plus laser interferometer demonstrator, NASA + Germany ? + Australia ??, launch 2015 !!!.
- Proposal to ESA under preparation
- Big interest in China and elsewhere
- All GRACE follow-on missions will carry laser interferometer, direct application of LISA technology!

eLIGO and Virgo+

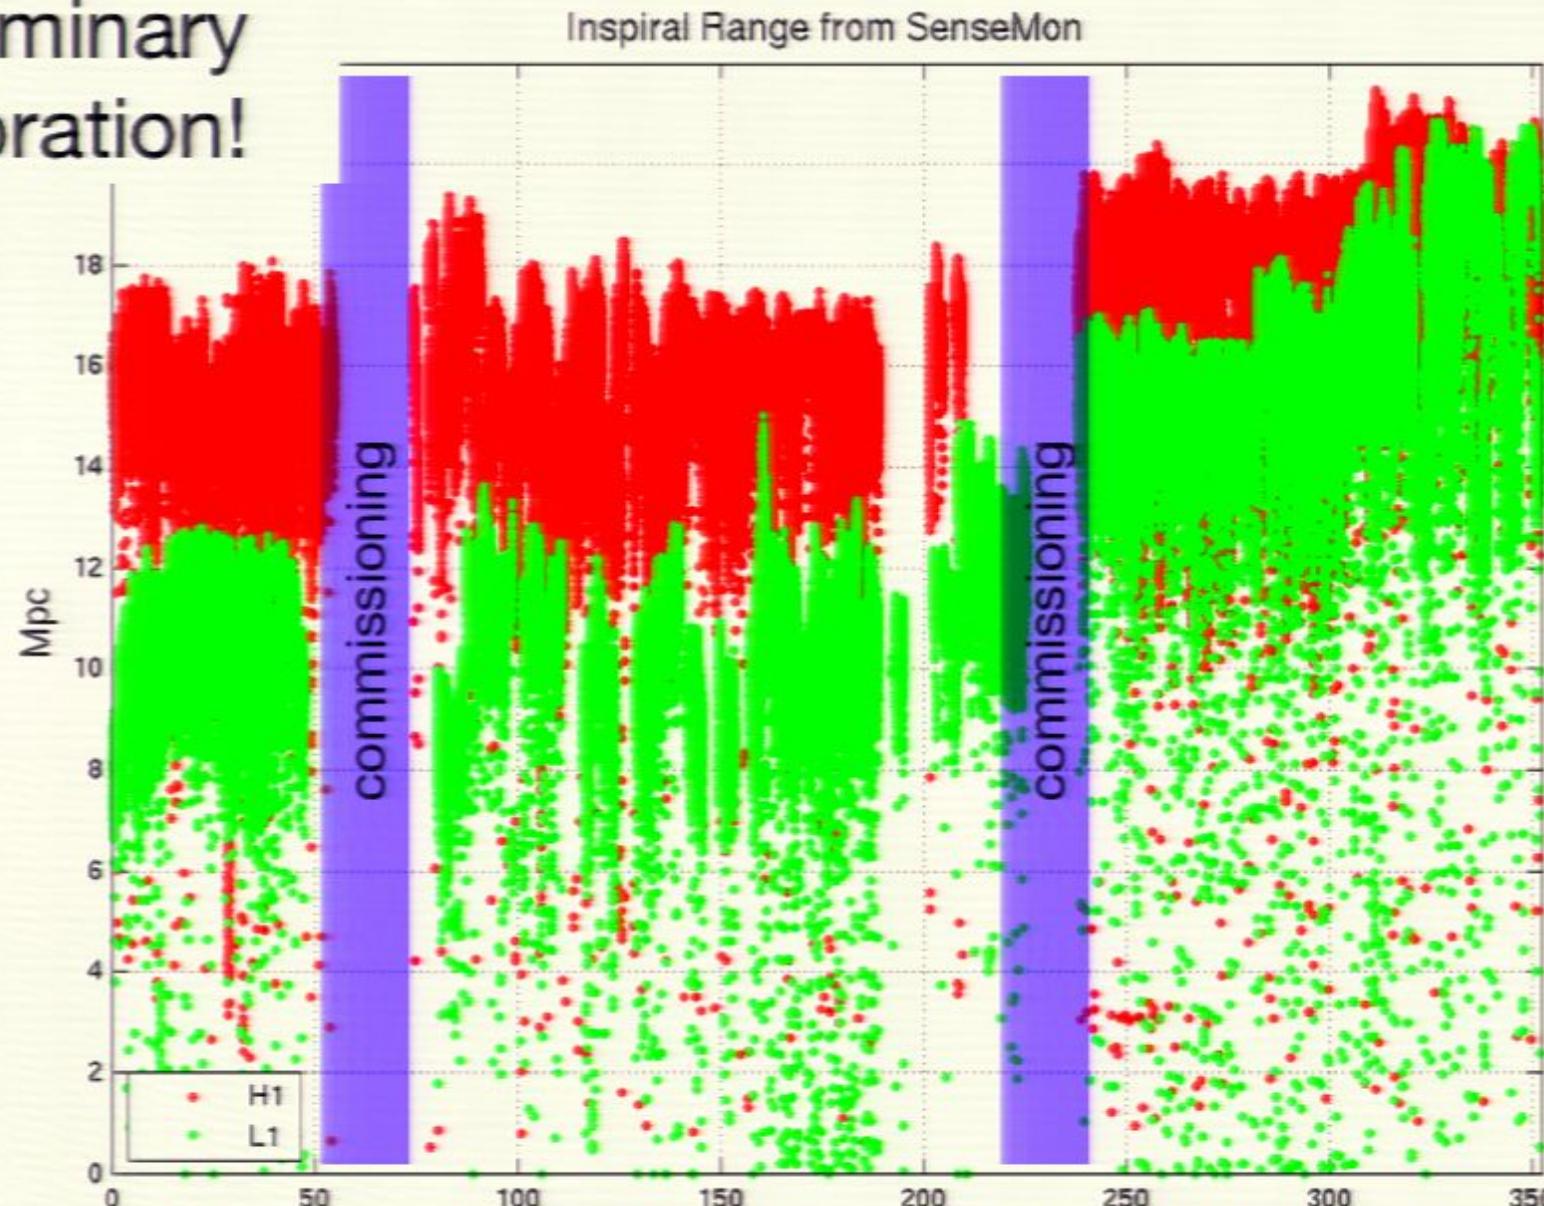

Virgo+ on schedule for mid-July VSR3
Test masses monolithically suspended
ITF robustly locked
Final tuning and noise-hunting remains

eLIGO running in S6 since July 7, 2009

DC readout
High power

Preliminary calibration!

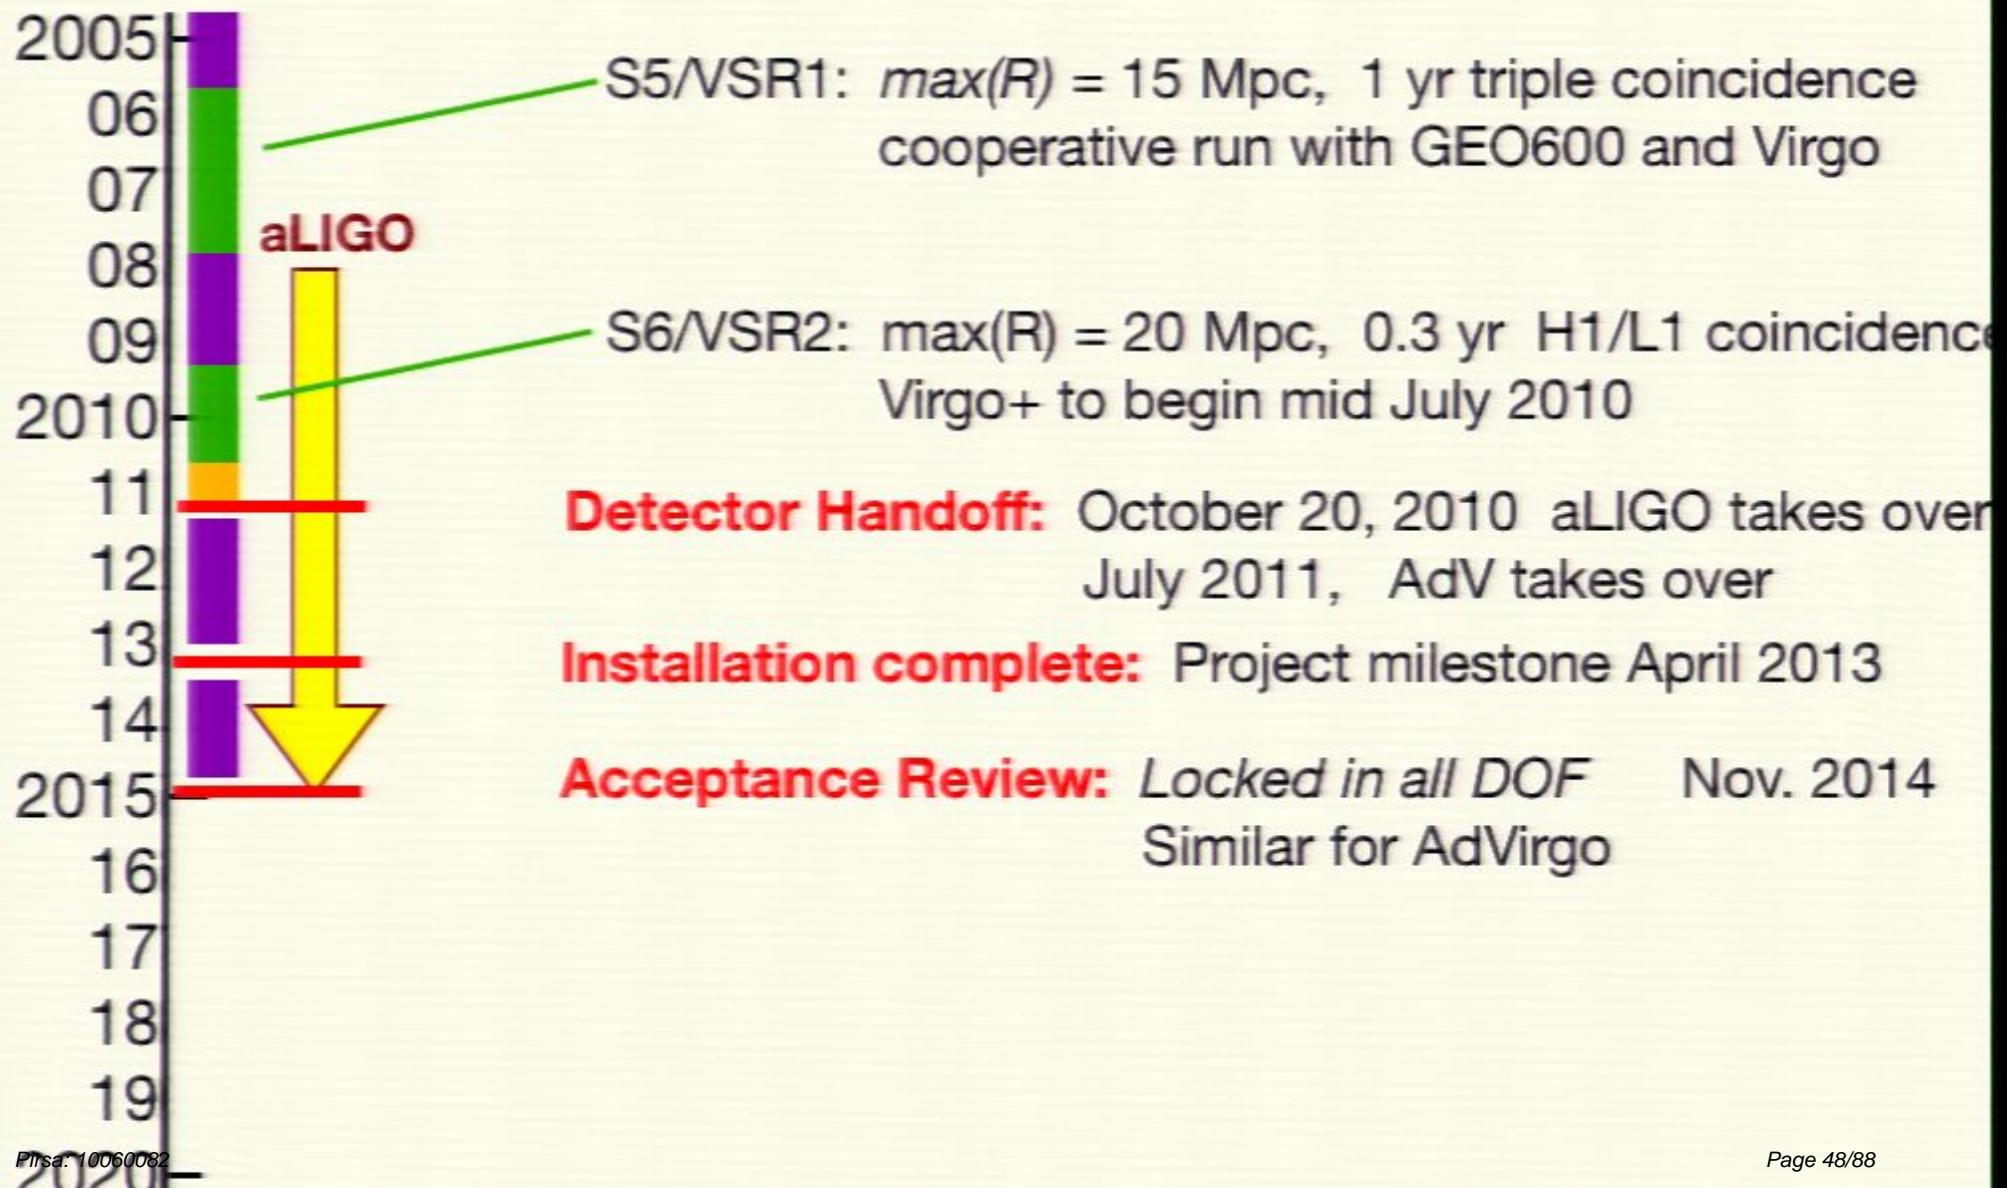

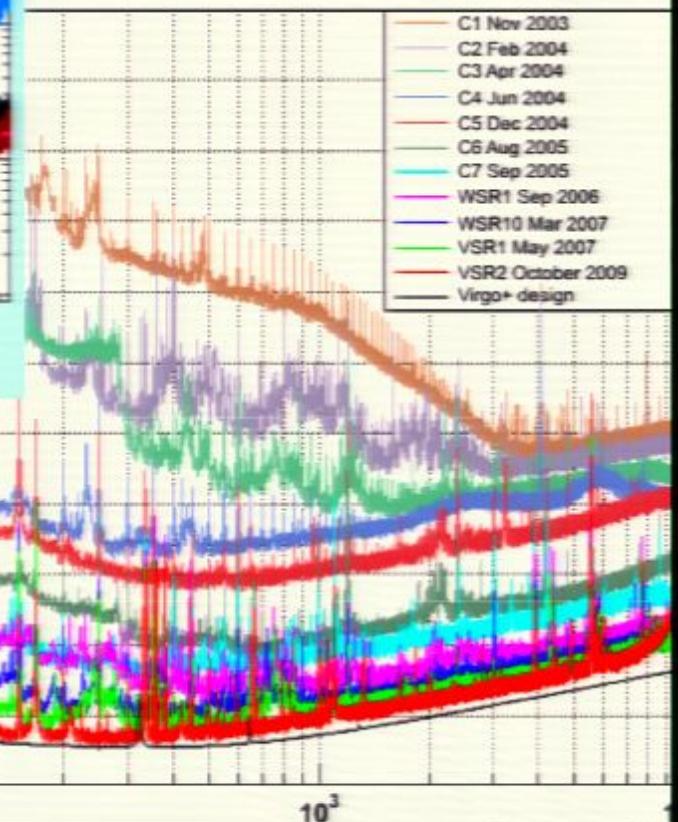

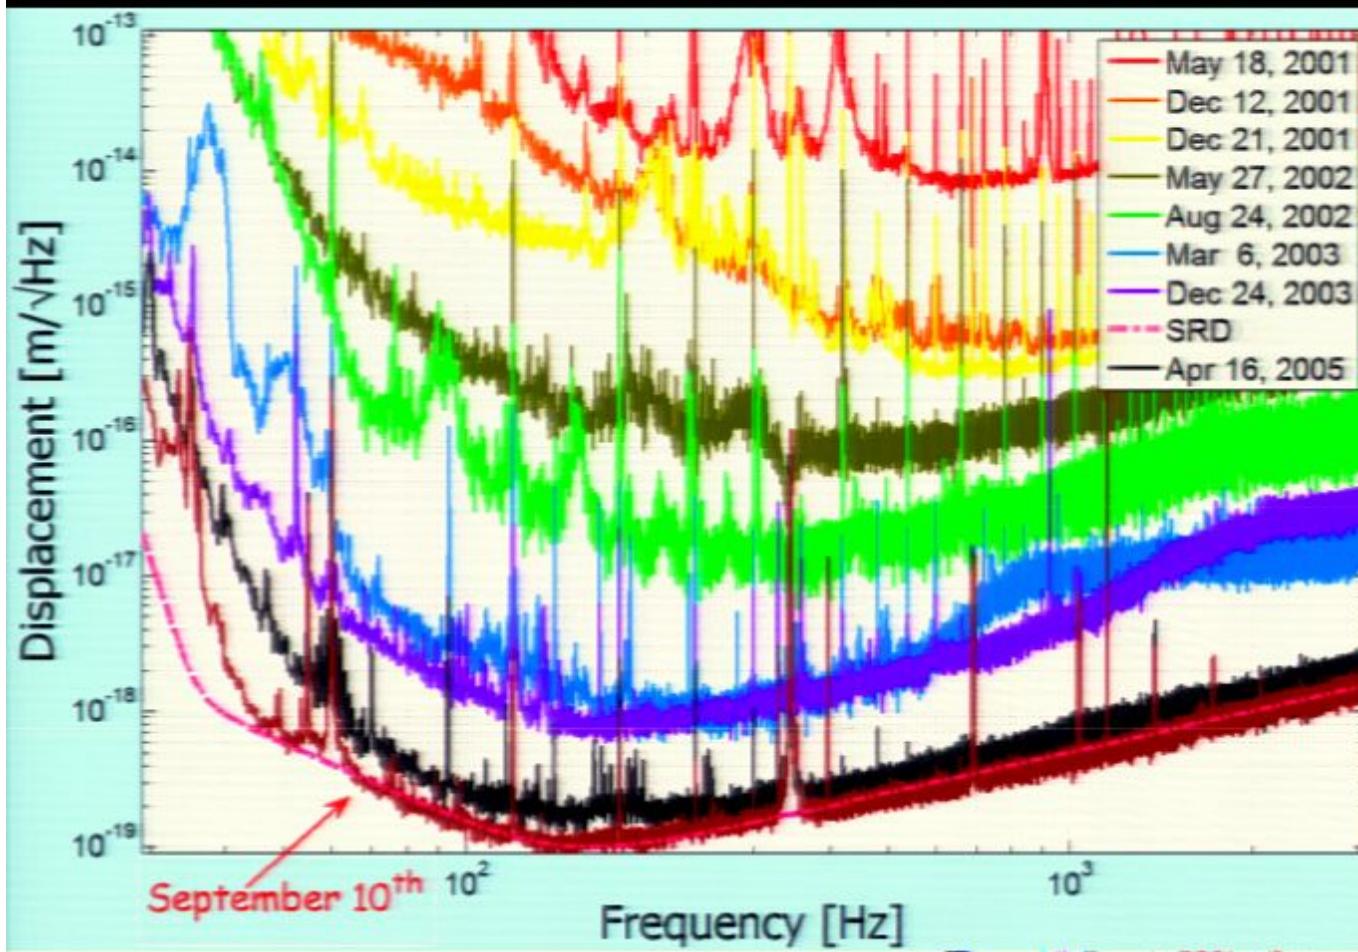

aLIGO commissioning

Have already commissioned:

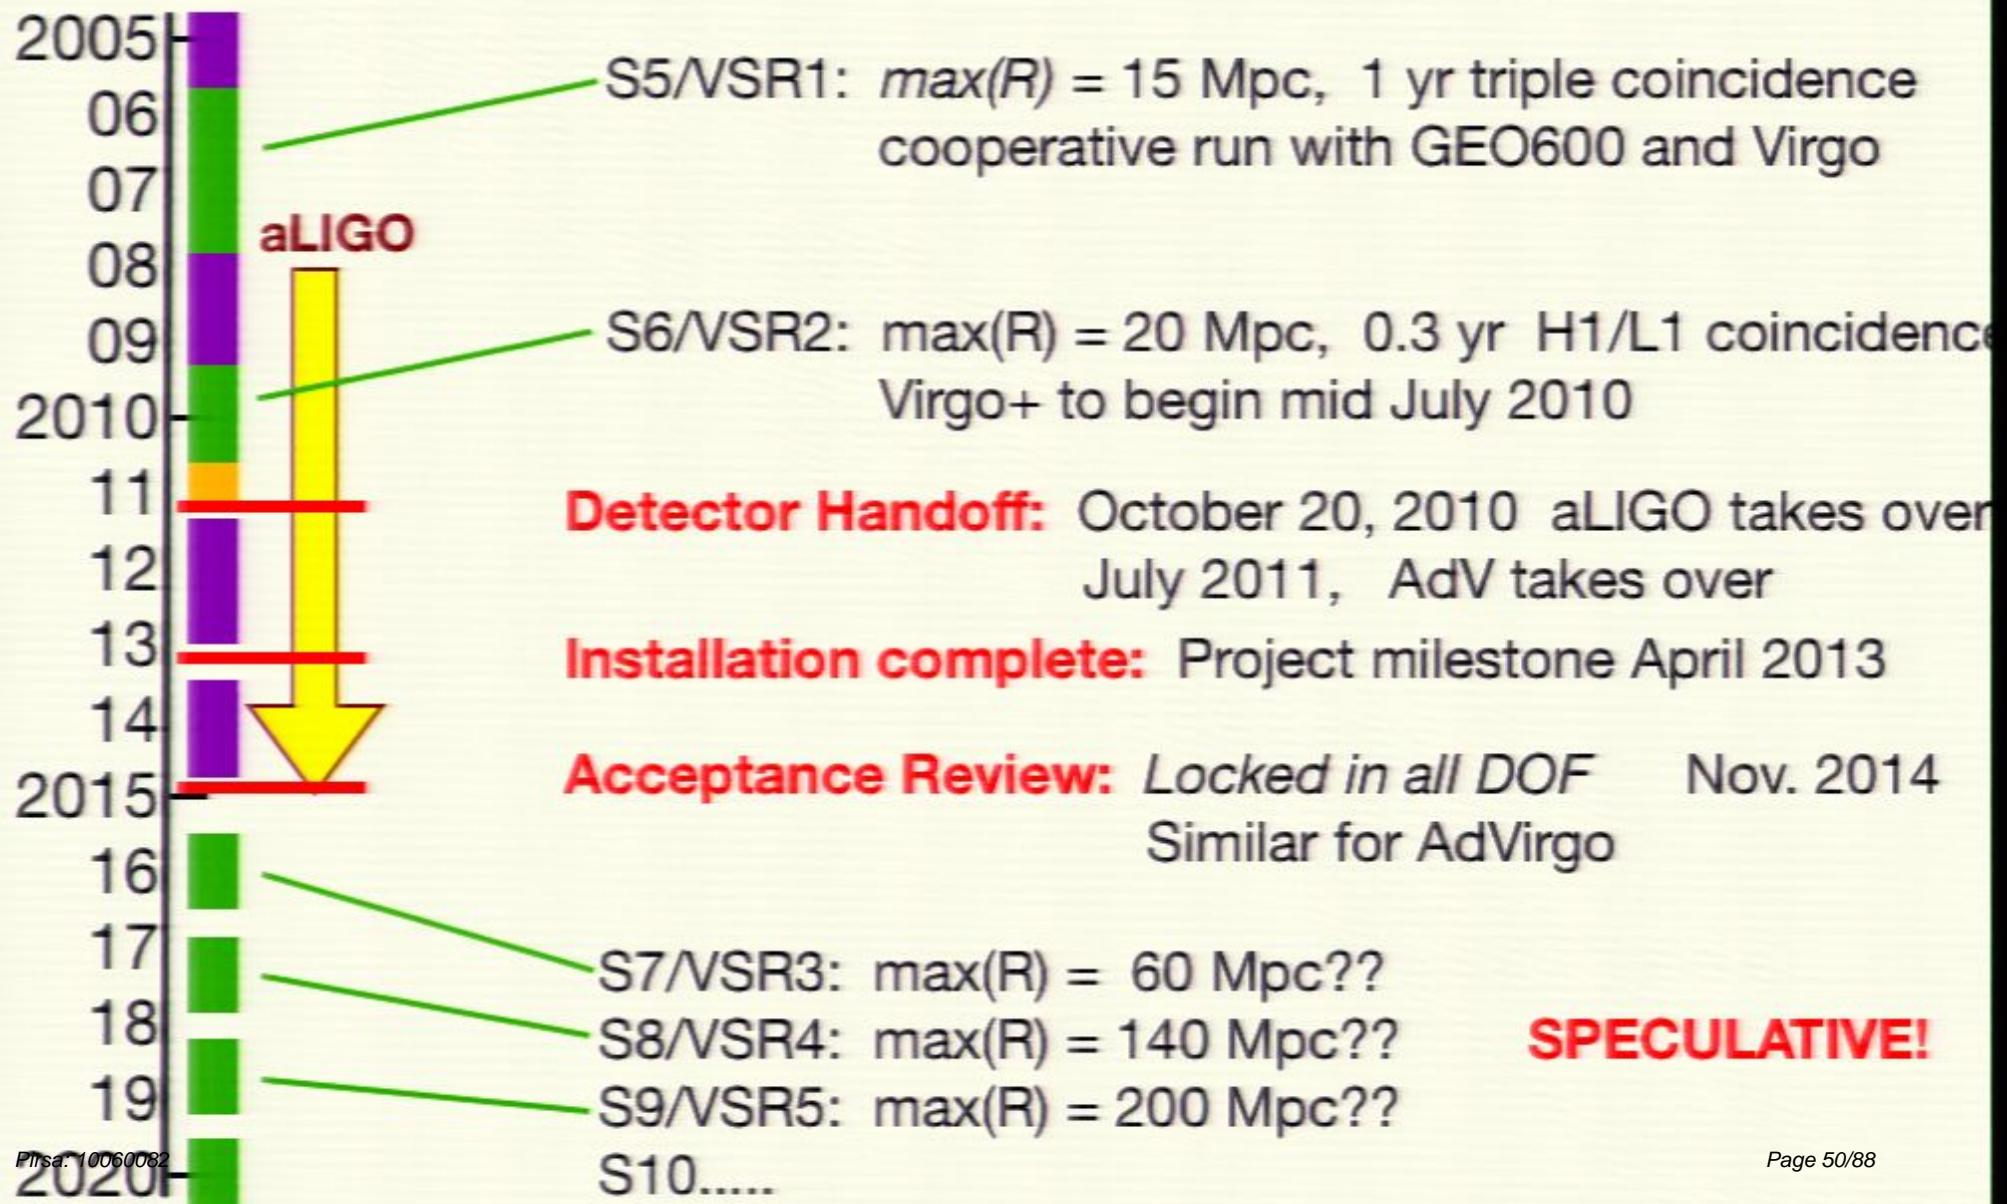

- ▶ DC readout (OMC alignment)
- ▶ Thermal Compensation System
- ▶ aLIGO DAQ and control
- ▶ HAM seismic isolation system
- ▶ 35 W of upgraded laser power
- ▶ High-power modulator and Faraday
- ▶ Feedforward seismic isolation
