

Title: Adventures in Superstrings

Date: Jul 21, 2010 10:30 AM

URL: <http://pirsa.org/10070033>

Abstract: Physics emerged from the twentieth century with two remarkably successful descriptions of nature which stand in striking contrast. Quantum mechanics describes the subatomic realm with intrinsic uncertainties and probabilities. On the other hand, Einstein's general relativity describe gravitational phenomena in an exacting geometric arena. Theoretical physicists have struggled for over fifty years trying to combine these views in a single unified framework. More recently, superstring theory has drawn a huge amount of interest as a leading contender to provide such a unification. Superstring theory is a theory of strings, branes, extra spacetime dimensions and much more. In my lecture, I will try to give a flavour for what superstring theory is all about and why physicists, like myself, continue to be so excited about this, perhaps the final theory.

The Superstring Adventure

Robert Myers

Einstein:

Gravity: It's all just straight lines!

Special Relativity (1905):

Space and time are inextricably linked ➡ Spacetime

General Relativity (1915):

Gravity is a manifestation of spacetime curvature.

General Relativity: a rich source of new ideas

Black holes

Gravitational waves

General Relativity is rigorously tested!!

- Deflection of Light by the Sun
- Gravitational Redshift
- Precession of the Perihelion of Mercury
- Time Delay of Light,

Hulse and Taylor:
Nobel Prize in 1993!!

General Relativity is rigorously tested!!

Global Positioning System (GPS):

Accurate positioning requires accounting for affects of general relativity on clocks in orbit and on earth

General Relativity is rigorously tested!!

- Deflection of Light by the Sun
- Gravitational Redshift
- Precession of the Perihelion of Mercury
- Time Delay of Light,

Hulse and Taylor:
Nobel Prize in 1993!!

General Relativity is the geometric arena of physics on very **large** scales:

planets stars galaxies cosmology

Quantum Mechanics (or Quantum Field Theory) is the probabilistic arena of physics on very **small** scales

Particles can act like waves!

de Broglie wavelength: $\lambda = \frac{2\pi \hbar}{p}$ ← Planck's constant

$$\lambda_{\text{rain drop}} \approx 4 \times 10^{-30} \text{ m}$$

Positions are uncertain
for the very small !

Quantum theory is rigorously tested!!

Example: electrons are tiny magnets

$$\mu_e = g e \hbar / 4m_e \quad \text{with} \quad g \approx 2$$

precise value of magnetic moment depends
on **quantum fluctuations**

Quantum theory is rigorously tested!!

Example: electrons are tiny magnets

$$\mu_e = g e \hbar / 4m_e \quad \text{with} \quad g \approx 2$$

precise value of magnetic moment depends
on **quantum fluctuations**

$$\mu_{\text{measured}} = 2.0023193043738$$

Quantum theory is rigorously tested!!

Example: electrons are tiny magnets

$$\mu_e = g e \hbar / 4m_e \quad \text{with} \quad g \approx 2$$

precise value of magnetic moment depends
on **quantum fluctuations**

$$\mu_{\text{measured}} = 2.0023193043738$$

$$\mu_{\text{calculated}} = 2.0023193043070$$

Quantum theory is rigorously tested!!

Example: electrons are tiny magnets

$$\mu_e = g e \hbar / 4m_e \quad \text{with } g \approx 2$$

precise value of magnetic moment depends
on **quantum fluctuations**

$$\mu_{\text{measured}} = 2.0023193043738$$

$$\mu_{\text{calculated}} = 2.0023193043070$$

$$\left| \frac{\mu_{\text{calculated}} - \mu_{\text{measured}}}{\mu_{\text{measured}}} \right| < 10^{-10}$$

Quantum theory is rigorously tested!!

Example: electrons are tiny magnets

$$\mu_e = g e \hbar / 4m_e \quad \text{with} \quad g \approx 2$$

precise value of magnetic moment depends
on **quantum fluctuations**

$$\mu_{\text{measured}} = 2.0023193043738$$

$$\mu_{\text{calculated}} = 2.0023193043070$$

(neither answer absolutely correct)

Quantum theory is rigorously tested!!

e.g., magnetic moment of the electron, $\mu_e = g \frac{e \hbar}{4m_e} I$
is modified by quantum fluctuations

$$\left| \frac{\mu_{\text{theory}} - \mu_{\text{experiment}}}{\mu_{\text{experiment}}} \right| \leq 10^{-10}$$

e.g., Lamb shift: shift between $2S_{1/2}$ and $2P_{1/2}$
energy levels of hydrogen atom ($f = 1057$ MHz)

$$\left| \frac{f_{\text{theory}} - f_{\text{experiment}}}{f_{\text{experiment}}} \right| \leq 10^{-6}$$

Quantum Theory: a rich source of new ideas

- band structure in materials → semiconductor technology
- Bose-Einstein condensation → superfluids, superconductors
- quantum Hall effect, neutron diffraction, electron microscopy, lasers, magnetic resonance imaging, ...

Strings tame
the particle zoo!

Superstrings: the theory of subatomic physics

The essential idea:

with sufficient resolution, all elementary particles are one-dimensional objects (strings)

all particle types are the same kind of string vibrating or rotating in different ways

Superstrings: the theory of subatomic physics

The idea:

with sufficient resolution, all elementary particles are one-dimensional objects (strings)

all particle types are the same kind of string vibrating or rotating in different ways

the typical size of the strings is the fundamental scale of the theory, $\ell_s = 10^{-35} \text{ m}$

Superstrings: the theory of subatomic physics

The idea:

with sufficient resolution, all elementary particles are one-dimensional objects (strings)

all particle types are the same kind of string vibrating or rotating in different ways

the typical size of the strings is the fundamental scale of the theory, $\ell_s = 10^{-35} \text{ m}$

Interactions?

coupling constant, g ,
determines probability
of interaction

coupling constant, g ,
determines probability
of interaction

Superstrings: the theory of subatomic physics

with resolution, $\ell_s = 10^{-35}$ m, all elementary particles are one-dimensional objects (strings)

interactions are geometric joining and splitting governed by coupling constant, g

with these simple rules get appropriate particle species and interactions to match **Standard Model**

Subatomic Physics → a theory of strings!

consistency **requires** appearance of **the graviton!**

at long distances much greater than ℓ_s , reproduces Einstein's gravitational equations

$$R_{\mu\nu} - \frac{1}{2}R g_{\mu\nu} = 8\pi \textcircled{G} T_{\mu\nu} \quad \text{Newton's constant}$$

sets the string length scale: $\ell_s \approx \sqrt{\frac{G\hbar}{c^3}} = 10^{-35} \text{ m}$

Superstrings naturally provides a unified framework
for **Quantum Field Theory** and **General Relativity**

Superstring theory: The devil is in the “details”

- Predicts we live in 10 spacetime dimensions!!

*Experimental update: we live in 4 dimensions!
(1 time and 3 space)*

Superstring theory: The devil is in the “details”

- Predicts we live in 10 spacetime dimensions!!

Experimental update: we live in 4 dimensions!

Big fix: Perhaps we haven't seen the extra dimensions yet.

Superstring theory: The devil is in the “details”

- Predicts we live in **10 spacetime dimensions!!**

Experimental update: we live in 4 dimensions!

Big fix: Perhaps we haven't seen the extra dimensions yet.

Superstring theory: The devil is in the “details”

- Predicts we live in **10 spacetime dimensions!!**

Experimental update: we live in 4 dimensions!

Benefit: richness of four-dimensional physics comes from geometry of the extra dimensions

Superstring theory: The devil is in the “details”

- Predicts we live in 10 spacetime dimensions!!

Experimental update: we live in 4 dimensions!

Big fix: Perhaps we haven't seen the extra dimensions yet.

Superstring theory: The devil is in the “details”

- Predicts we live in **10 spacetime dimensions!!**

Experimental update: we live in 4 dimensions!

Benefit: richness of four-dimensional physics comes from geometry of the extra dimensions

Superstring theory: The devil is in the “details”

- Predicts we live in **10 spacetime dimensions!!**

Experimental update: we live in 4 dimensions!

- Predicts extra particles we haven't seen yet!

(**Supersymmetry**: each fermion is accompanied by a bosonic partner of the same mass)

Superstring theory: The devil is in the “details”

- Predicts we live in **10 spacetime dimensions!!**

Experimental update: we live in 4 dimensions!

- Predicts extra particles we haven't seen yet!

(**Supersymmetry**: each fermion is accompanied by a bosonic partner of the same mass)

Big fix: Perhaps we should look harder.

Benefit: SUSY tames the short distance (quantum) fluctuations of the theory

Superstring theory: Details, details, details,

- Have **five** consistent superstring theories:
Type I, Type IIA, Type IIB,
Heterotic $E_8 \times E_8$, Heterotic $SO(32)$

one universe \longrightarrow **four** too many theories?!?

Superstring theory: Details, details, details,

- Have five consistent superstring theories:
Type I, Type IIA, Type IIB,
Heterotic $E_8 \times E_8$, Heterotic $SO(32)$
- New perspective: all known string theories are
different phases of single fundamental theory

→ M-theory

Essential ingredients for M-theory conjecture:

- Dualities: two mathematical descriptions describe identical physical phenomena

Essential ingredients for M-theory conjecture:

- Dualities: two mathematical descriptions describe identical physical phenomena

Eg, T-duality relates large and small circle compactifications

$$C_2 = \frac{2\pi \ell_s^2}{R}$$

Essential ingredients for M-theory conjecture:

- Dualities: two mathematical descriptions describe identical physical phenomena

Eg, T-duality relates large and small circle compactifications

Essential ingredients for M-theory conjecture:

- Dualities: two mathematical descriptions describe identical physical phenomena

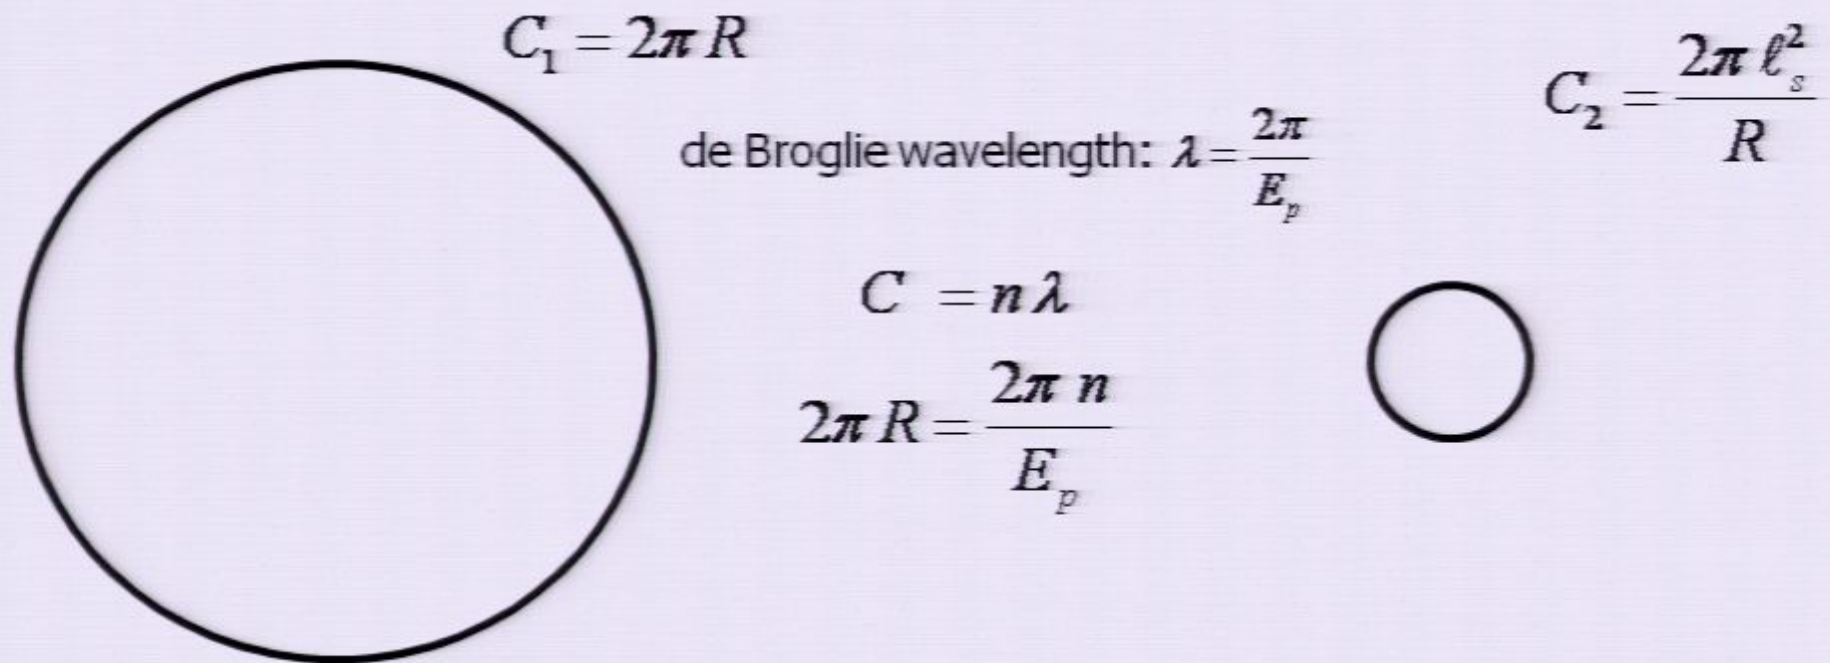

Eg, T-duality relates large and small circle compactifications

Essential ingredients for M-theory conjecture:

- Dualities: two mathematical descriptions describe identical physical phenomena

Eg, T-duality relates large and small circle compactifications

The diagram illustrates T-duality by showing two circles of different sizes. On the left is a large circle, and on the right is a small circle. Between them are several mathematical equations. Above the large circle is the equation $C_1 = 2\pi R$. Above the small circle is the equation $C_2 = \frac{2\pi \ell_s^2}{R}$. In the center, the de Broglie wavelength is given as $\lambda = \frac{2\pi}{E_p}$. Below this, the quantization condition $C = n\lambda$ is shown, followed by the equation $2\pi R = \frac{2\pi n}{E_p}$.

$$C_1 = 2\pi R$$

de Broglie wavelength: $\lambda = \frac{2\pi}{E_p}$

$$C = n\lambda$$
$$2\pi R = \frac{2\pi n}{E_p}$$
$$C_2 = \frac{2\pi \ell_s^2}{R}$$

Superstring theory: The devil is in the “details”

- Predicts we live in **10 spacetime dimensions!!**

Experimental update: we live in 4 dimensions!

- Predicts extra particles we haven't seen yet!

(**Supersymmetry**: each fermion is accompanied by a bosonic partner of the same mass)

Subatomic Physics \longrightarrow a theory of strings!

Elementary Particles (10^{-17} m)

Fermions:

electron, muon, tauon
neutrinos (3 flavors)
quarks - up, down, strange,
charm, bottom, top

Bosons (Force Mediators):

photon (electromagnetism)
gluon (strong)
 W^{\pm} , Z (weak)

Higgs particle

What's missing here?

Superstrings: the theory of subatomic physics

with resolution, $\ell_s = 10^{-35}$ m, all elementary particles are one-dimensional objects (strings)

interactions are geometric joining and splitting governed by coupling constant, g

with these simple rules get appropriate particle species and interactions to match **Standard Model**

Superstrings: the theory of **gravitational** physics

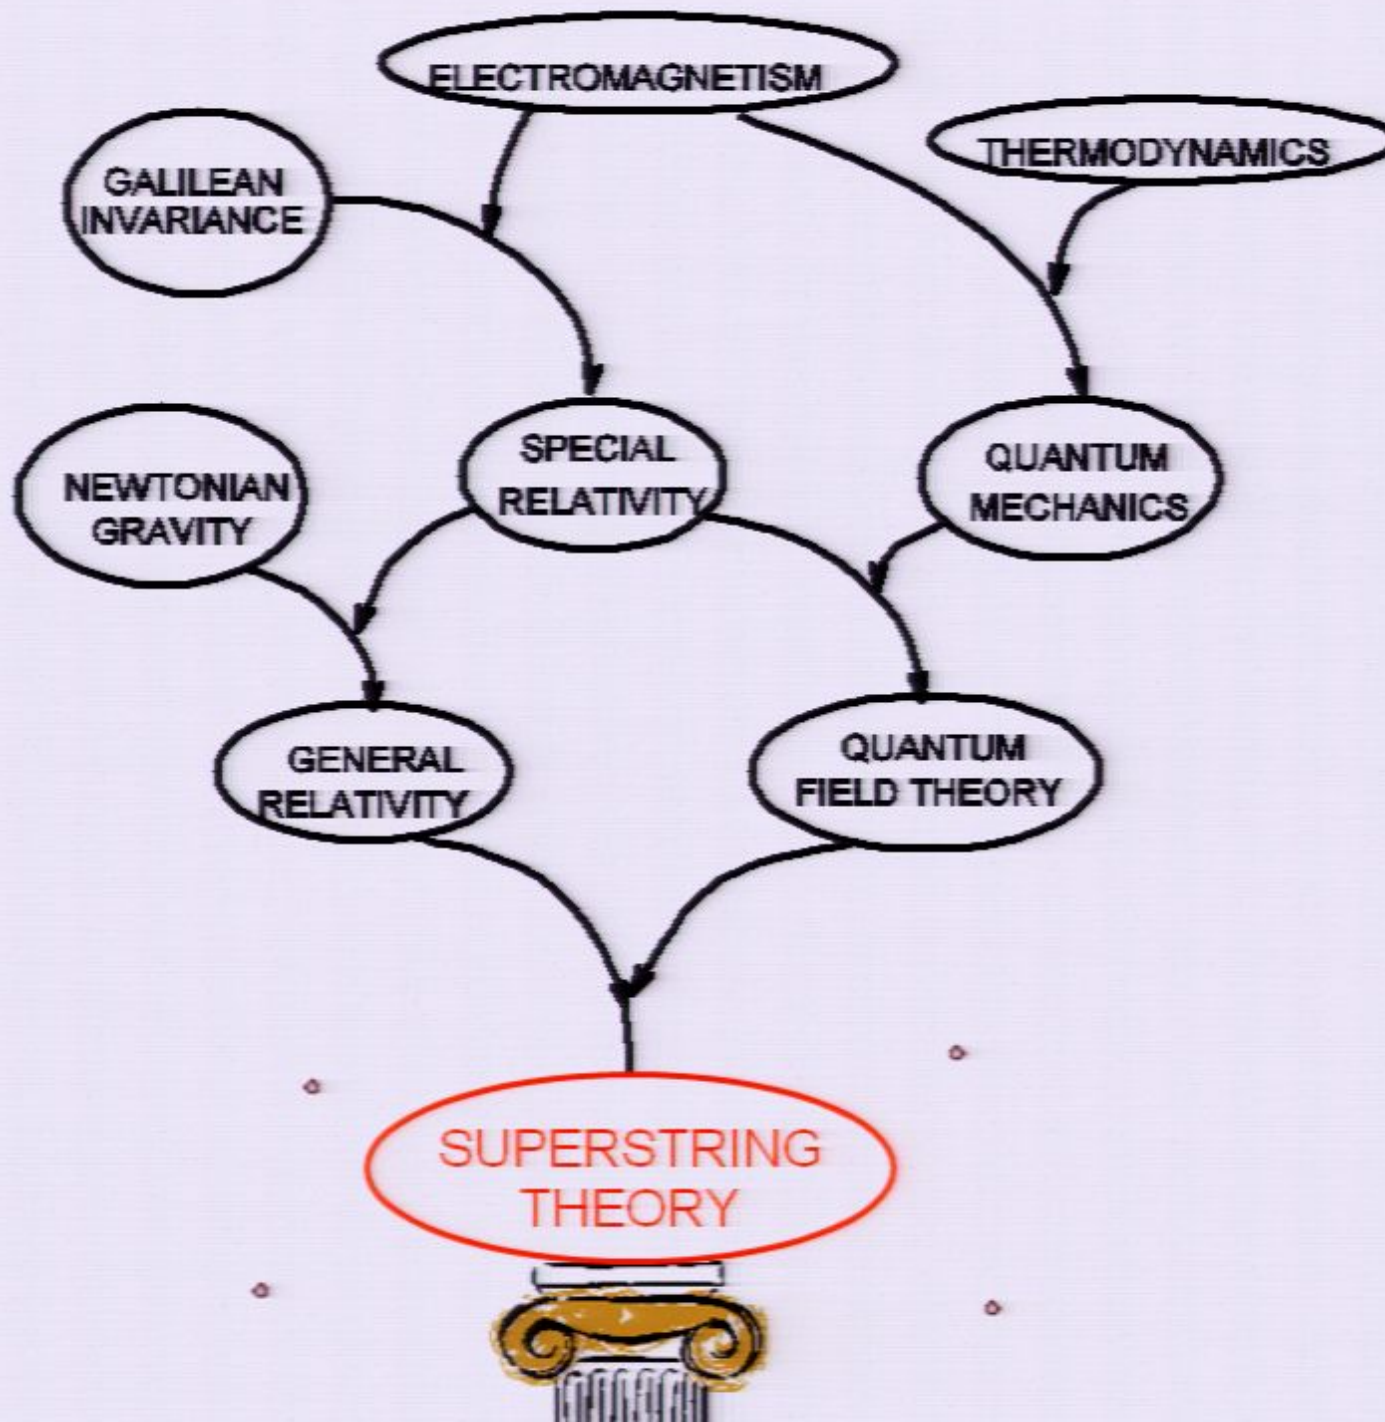

consistency **requires** appearance of **the graviton!**

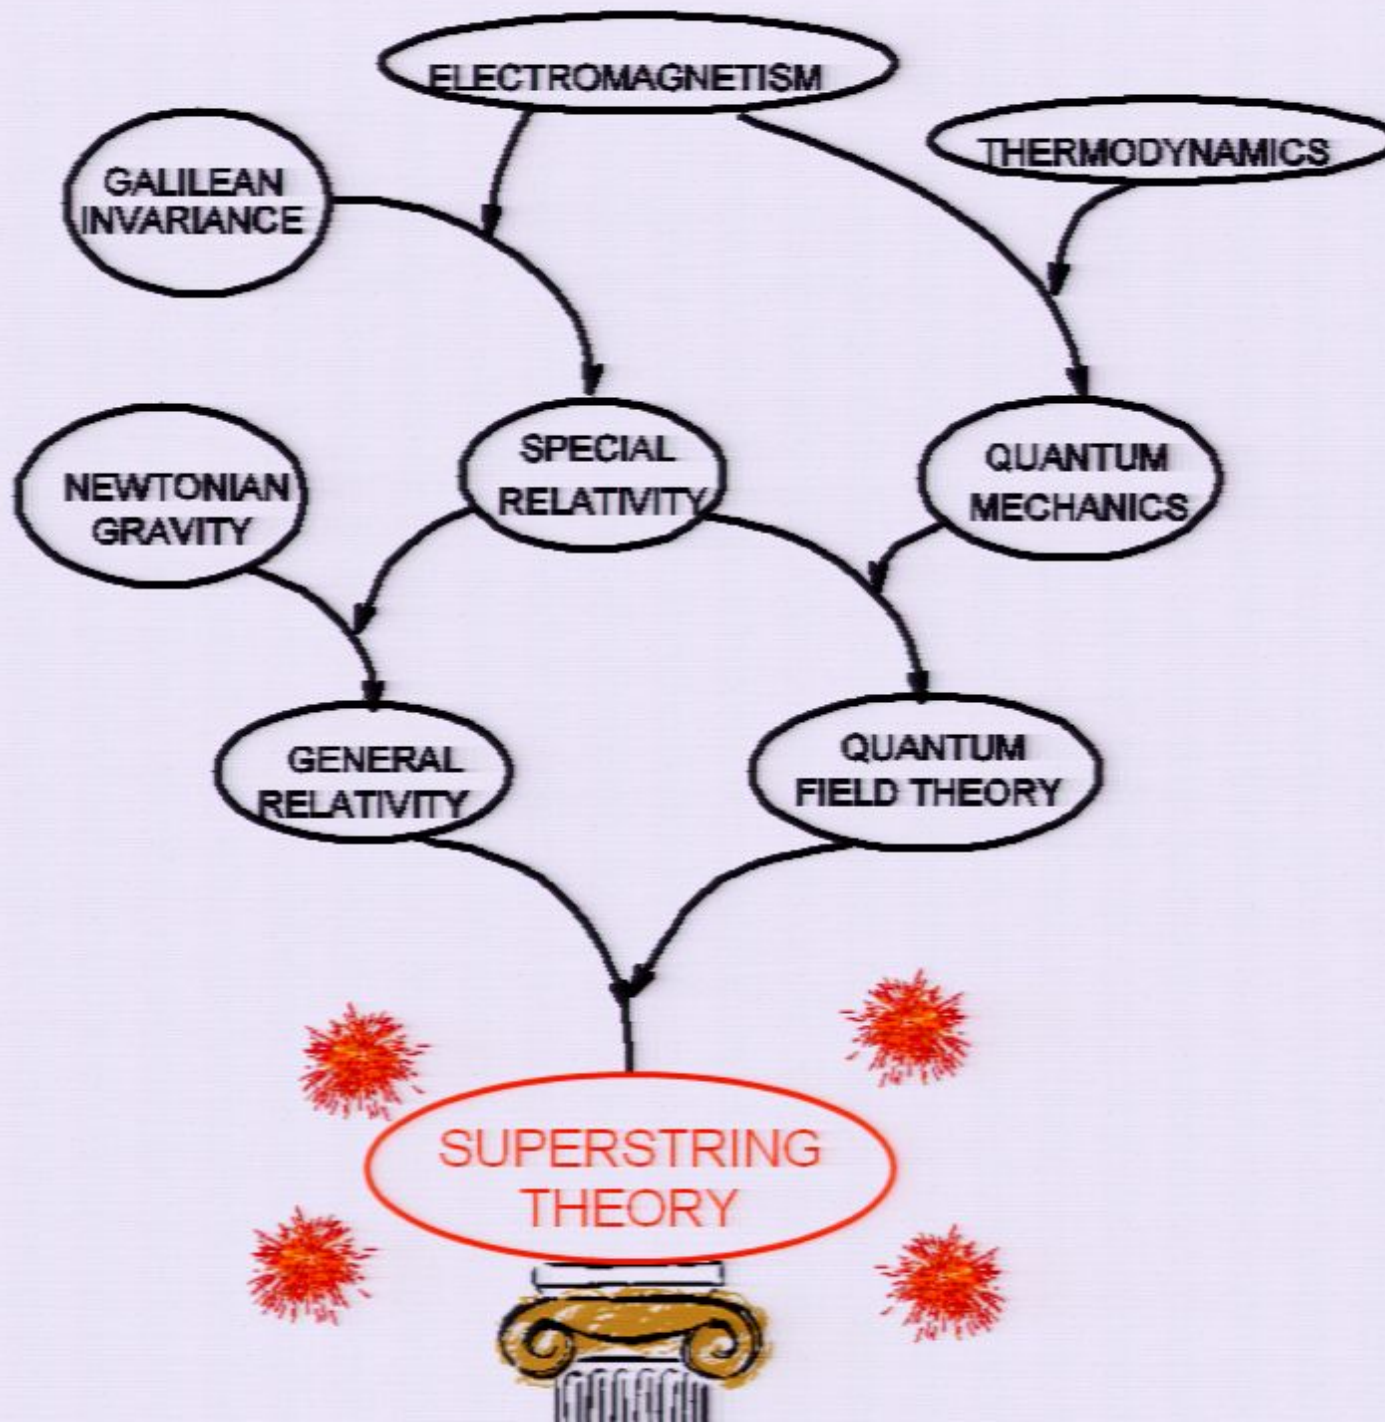

at long distances much greater than ℓ_s , reproduces Einstein's gravitational equations

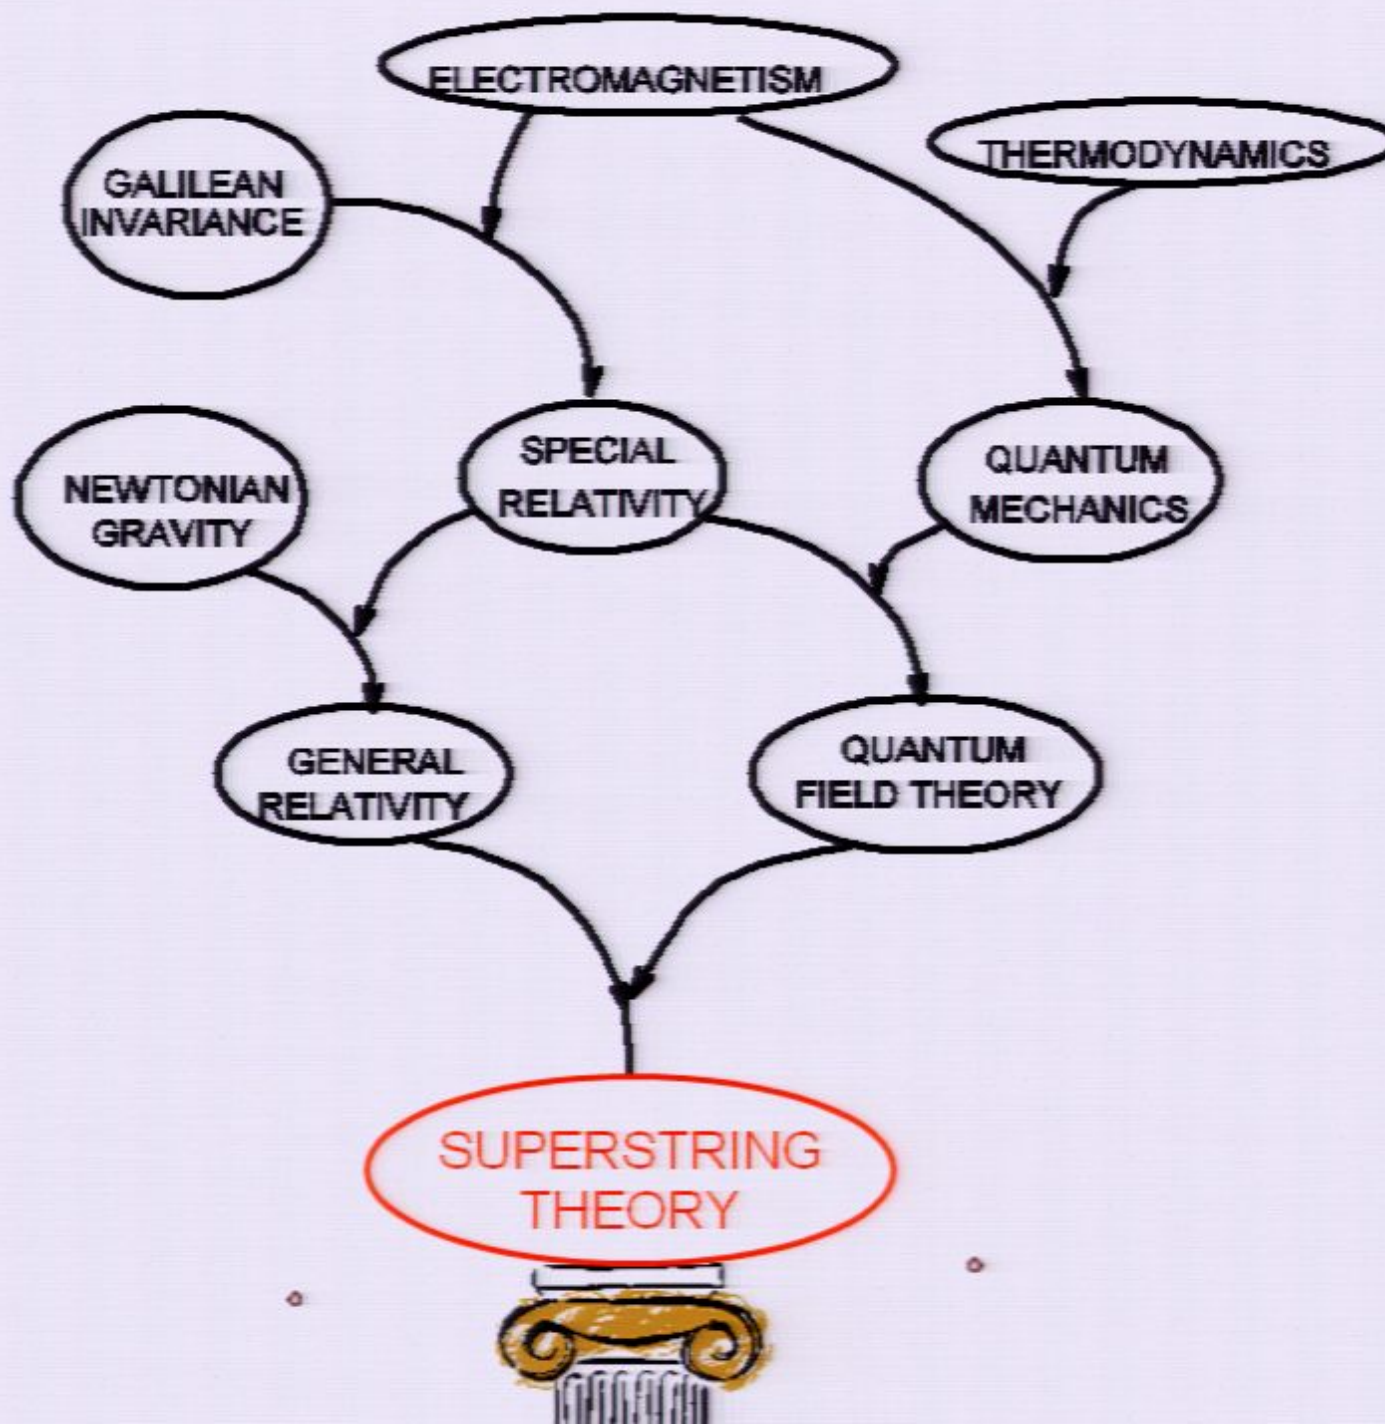

$$R_{\mu\nu} - \frac{1}{2}R g_{\mu\nu} = 8\pi \textcircled{G} T_{\mu\nu} \quad \text{Newton's constant}$$

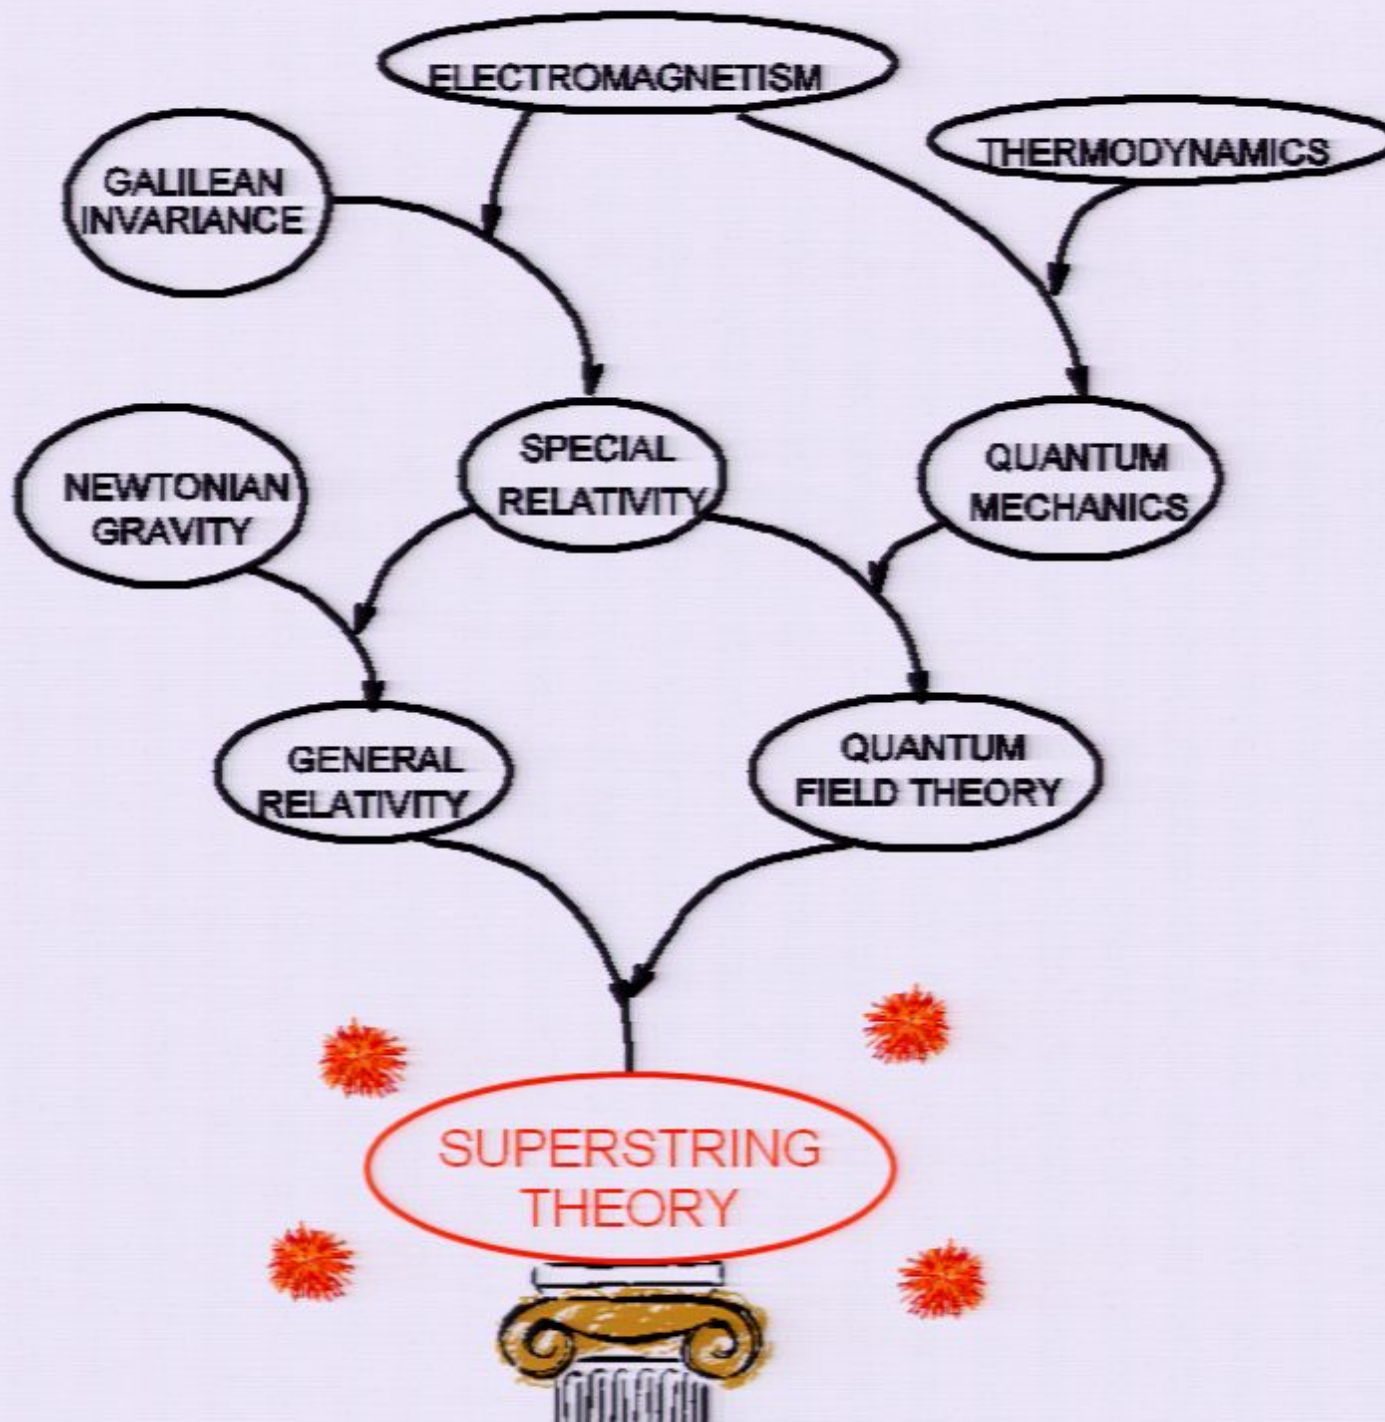

sets the string length scale: $\ell_s \approx \sqrt{\frac{\textcircled{G}\hbar}{c^3}} = 10^{-35} \text{ m}$

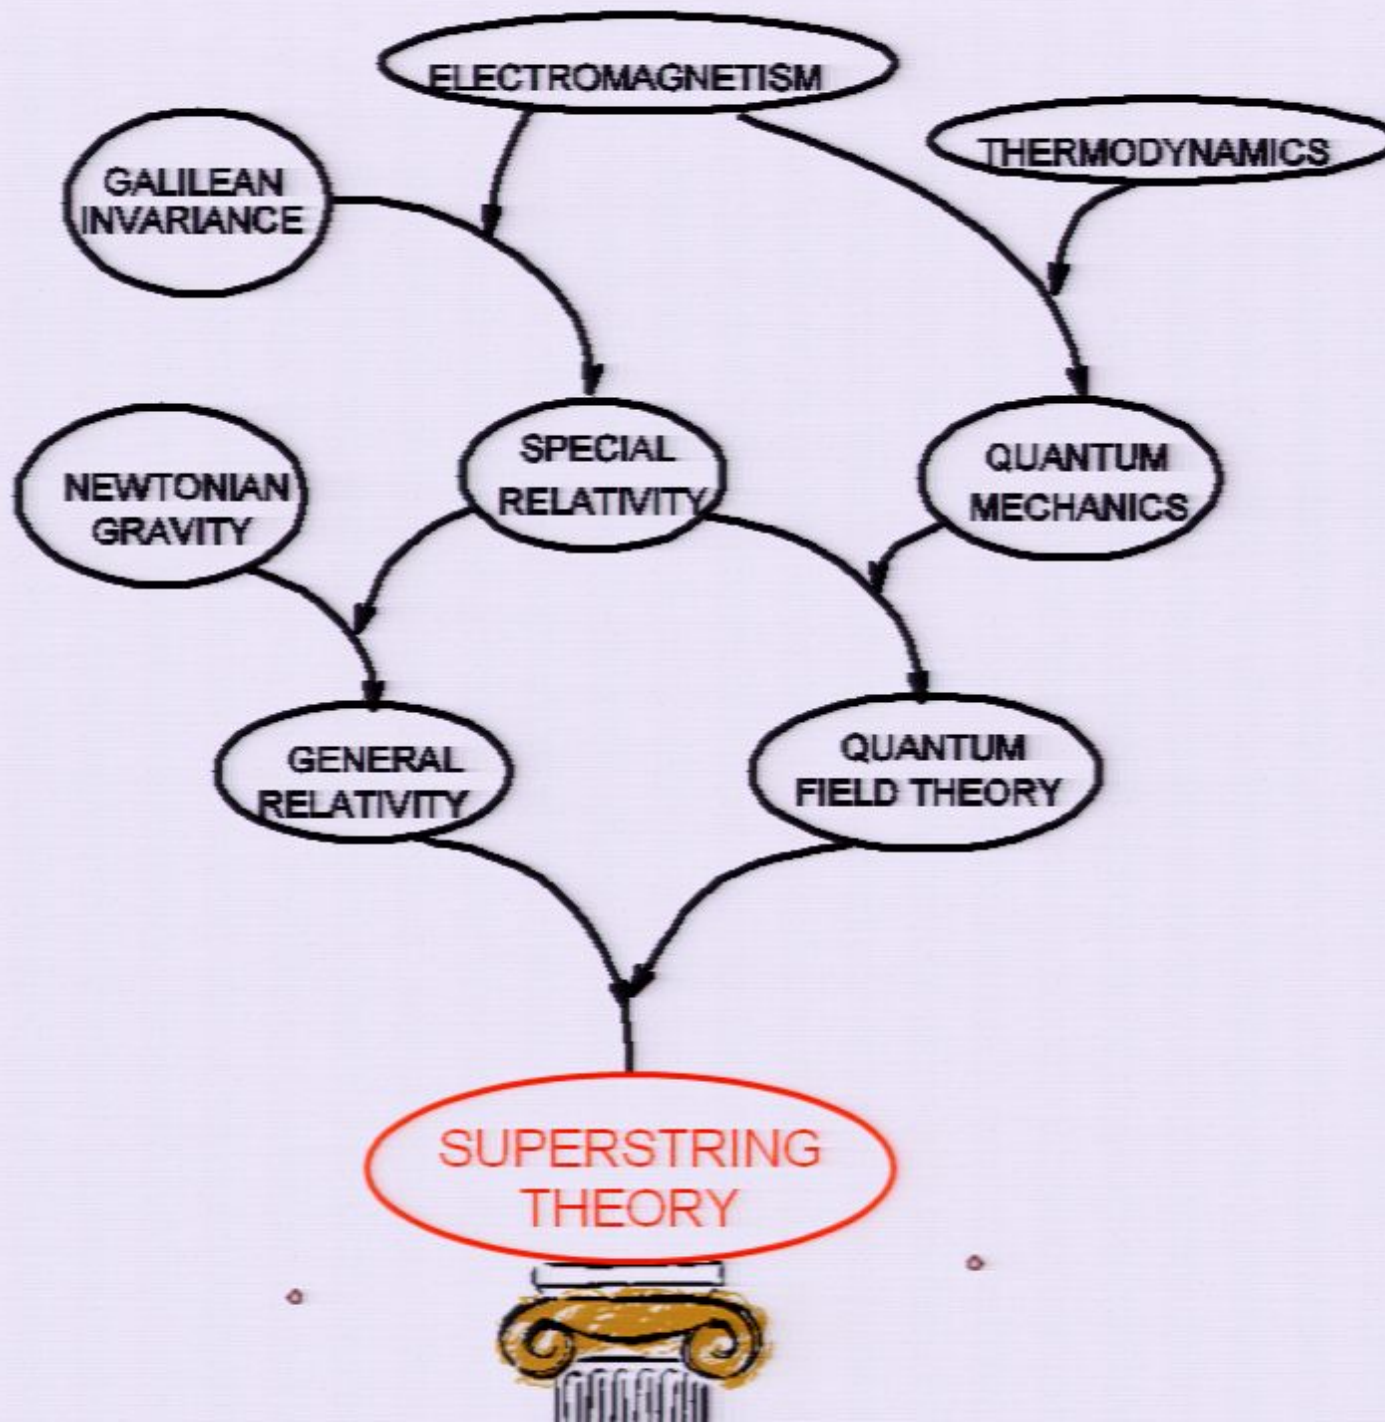

Superstrings naturally provides a unified framework
for **Quantum Field Theory** and **General Relativity**
