Outline

- Introduction
- IR effecs in Single Field Inflation
 - Log running $\log(H/\mu)$
 - $-\zeta$ is not time dependent
 - Zero effect from $\log(kL)$
 - One true IR effect (already resumed)
- Organizing principle:
 - -projection effects
 - -dynamical effects (null)

Outline

- Introduction
- IR effecs in Single Field Inflation
 - Log running $\log(H/\mu)$
 - $-\zeta$ is not time dependent
 - Zero effect from $\log(kL)$
 - One true IR effect (already resumed)
- Organizing principle:
 - -projection effects
 - -dynamical effects (null)

Who cares?

Tiny Effect

$$\langle \delta \phi_k^2 \rangle_{\rm tree} \sim \frac{H^2}{k^3}$$

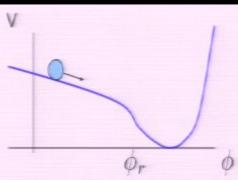

$$\langle \zeta_k^2 \rangle_{\rm tree} \sim \frac{H^2}{\epsilon M_{\rm Pl}^2} \frac{1}{k^3} \sim 10^{-10} \ \Rightarrow \ \langle \delta \phi_k^2 \rangle_{\rm 1-loop} \sim \frac{H^2}{k^3} \frac{H^2}{M_{\rm Pl}^2} \sim 10^{-10} \ \langle \delta \phi_k^2 \rangle_{\rm tree}$$

- · We have more interacting theories (large non-Gaussianities! but still small)
- Weinberg cares: understand prediction of your theory
 S.Weinberg PRD72:2005
 - These are the quantum corrections to the predictions of Inflation.
- · dS is a puzzling spacetime, and inflation is a regularization
- · Let us elaborate on this...

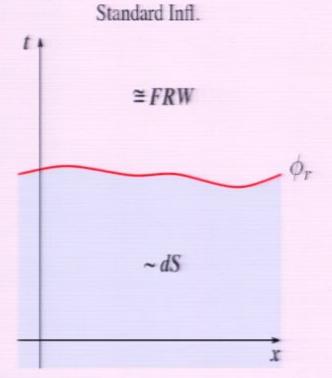

• If
$$\langle \delta \phi_k^2 \rangle \sim \frac{H^2}{k^3} \quad \Rightarrow$$

With Creminelli, Dubovsky, Nicolis and Zaldarriaga JHEP0809:036,2008

$$\langle \delta \phi(x,t)^2 \rangle = \int^{\Lambda a[t]} d^3k \frac{H^2}{k^3} \sim H^2 \log(a) \sim H^3 t + \text{const.} ,$$

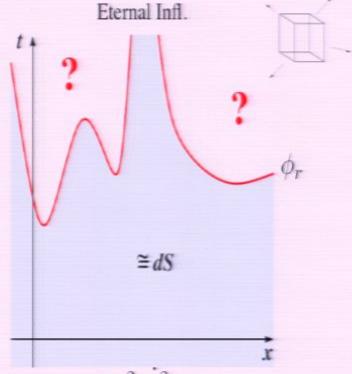

· With this you can prove that slow roll eternal inflation exists

Sharp phase transition:

for

 $P(V-\infty)\neq 0$

$$\Omega \equiv \frac{2\pi^2 \, \phi^2}{2\pi^2} < 1$$

• If
$$\langle \delta \phi_k^2 \rangle \sim \frac{H^2}{k^3} \quad \Rightarrow$$

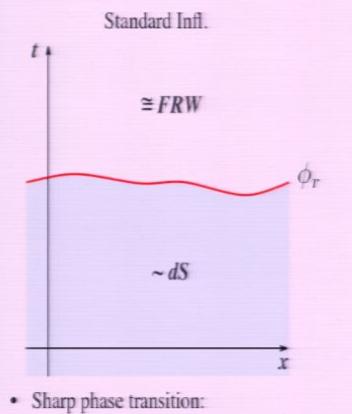

With Creminelli, Dubovsky, Nicolis and Zaldarriaga JHEP0809:036,2008

$$\langle \delta \phi(x,t)^2 \rangle = \int^{\Lambda a[t]} d^3k \frac{H^2}{k^3} \sim H^2 \log(a) \sim H^3t + \text{const.},$$

 $P(V-\infty)\neq 0$

· With this you can prove that slow roll eternal inflation exists

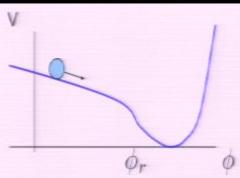

for

 $\cong dS$

Eternal Infl.

• If
$$\langle \delta \phi_k^2 \rangle \sim \frac{H^2}{k^3} \quad \Rightarrow$$

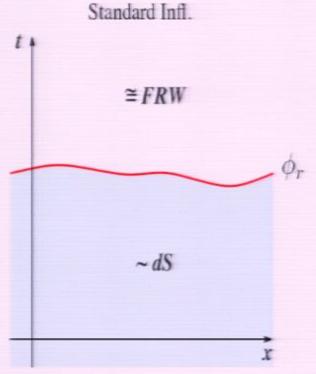

With Creminelli, Dubovsky, Nicolis and Zaldarriaga JHEP0809:036,2008

$$\langle \delta \phi(x,t)^2 \rangle = \int^{\Lambda a[t]} d^3k \frac{H^2}{k^3} \sim H^2 \log(a) \sim H^3t + \text{const.},$$

 $P(V-\infty)\neq 0$

· With this you can prove that slow roll eternal inflation exists

Sharp phase transition:

for O

 $\Omega \equiv \frac{2\pi^2}{2\pi^2} \frac{\phi^2}{W} < 1$

 $\cong dS$

Eternal Infl.

• If
$$\langle \delta \phi_k^2 \rangle \sim \frac{H^2}{k^3} \quad \Rightarrow$$

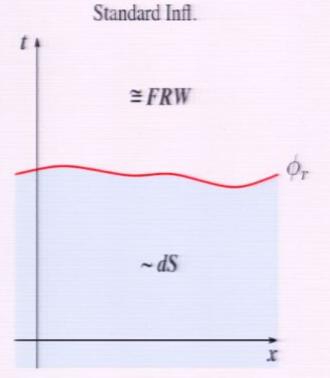

With Creminelli, Dubovsky, Nicolis and Zaldarriaga JHEP0809:036,2008

$$\langle \delta \phi(x,t)^2 \rangle = \int^{\Lambda a[t]} d^3k \frac{H^2}{k^3} \sim H^2 \log(a) \sim H^3t + \text{const.},$$

 $P(V-\infty)\neq 0$

· With this you can prove that slow roll eternal inflation exists

Sharp phase transition:

for $\Omega \equiv \frac{2\pi^2}{2\pi^2} \frac{\dot{\phi}^2}{\dot{\phi}^2}$

· With quite more work:

$$P(V>e^{\frac{S_{\mathrm{ds}}}{2}}) < e^{-\alpha S_{\mathrm{ds}}}$$

· All of this fails if

With Dubovsky and Villadoro

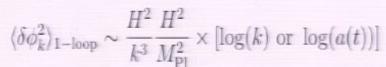

JHEP0904:118,2009

Predictivity of Inflation

• If
$$\langle \zeta_k^2 \rangle_{1-\text{loop}} \sim \langle \zeta_k^2 \rangle_{\text{tree}} \frac{H^4}{\dot{H} M_{\text{Pl}}^2} \log{(a(t))}$$
 when $k/a \ll H$

– if ζ is time in-dependent: ok

- if ζ is time-dependent, we need to know the history.
- this is a weakly coupled version of what could happen at other epochs

Log Running

Log Running

- Weinberg's result
- $\langle \zeta_k^2 \rangle_{1-\text{loop}} \sim \langle \zeta_k^2 \rangle_{\text{tree}} \log (k/\mu)$

S. Weinberg PRD72:2005 and others thereafter

- Gives you all these troubles (Eternal Inflation, Predictivity of Inflation)
- But problem with gauge symmetry $a \to \lambda a$, $x \to x/\lambda$, $k \to \lambda k$

Study this finding the simplest possible theory

$$S = \int d^4x \ a^3 \left[-\dot{H} M_{\rm Pl}^2 \left(\dot{\pi}^2 - \frac{1}{a^2} (\partial_i \pi)^2 \right) + \frac{2}{3} c_3 M^4 \left(2 \dot{\pi}^3 + 3 \dot{\pi}^4 - 3 \frac{1}{a^2} \dot{\pi}^2 (\partial_i \pi)^2 \right) \right]$$

- Technical problem in implementing the regularization
- $\langle \zeta_k^2 \rangle_{1-\text{loop}} \propto H^6 \log (H/\mu)$

with Zaldarriaga 0912:2734 [hep-th]

Effect in the IR much larger than in Minkowsky space

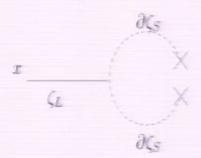

$$\langle \zeta_k^2 \rangle_{1-\text{loop}} \propto k^6 \log (k/\mu)$$

Based on EFT of Inflation with C. Cheung, P. Creminelli, L. Fitzpatrick, J. Kaplan IHEP 0803:014.2008

Tadpole Diagrams (and no time-dependent ζ)

Tadpole Diagrams

with Zaldarriaga 0912:2734 [hep-th]

- · You need to renormalize the history
- and define ζ accordingly

$$\begin{split} 3M_{\rm Pl}^2 H^2 &= \frac{1}{2} \dot{\phi}(t)^2 + V \left(\phi(t) \right) + \langle \rho_{\sigma}(t) \rangle_0 \;, \\ M_{\rm Pl}^2 \left(3H^2 + 2\dot{H} \right) &= -\frac{1}{2} \dot{\phi}(t)^2 + V \left(\phi(t) \right) - \langle p_{\sigma}(t) \rangle_0 \\ ds^2 &= -dt^2 + a(t)_B^2 e^{2\zeta} dx^2 \end{split}$$

· In practice:

$$\begin{split} S_m &= \int d^4x \, \sqrt{-g} &\qquad \left[\dot{H}_{\rm tree} M_{\rm Pl}^2 \, \delta g^{00} + \left(3 H_{\rm tree}^2 + \dot{H}_{\rm tree} \right) M_{\rm Pl}^2 \right] = \\ &= \int d^4x \, \sqrt{-g} &\qquad \left[\left(\dot{H}_{\rm tree} + \delta \dot{H} \right) M_{\rm Pl}^2 \, \delta g^{00} + \left(3 \left(H_{\rm tree} + \delta \dot{H} \right)^2 + \left(\dot{H}_{\rm tree} + \delta \dot{H} \right) \right) M_{\rm Pl}^2 \\ &\qquad - \delta \dot{H} M_{\rm Pl}^2 \, \delta g^{00} - \left(3 H_{\rm tree} \delta H + \delta \dot{H} \right) M_{\rm Pl}^2 \right] \; . \end{split}$$

· Tadpole cancellation:

z ζ_L χ

=()

Page 22/41

• Define / here.

Woodard's claim

• ζ s time-dependent

$$\langle \zeta_k^2 \rangle_{1-\text{loop}} \sim \langle \zeta_k^2 \rangle_{\text{tree}} \frac{H^4}{\dot{H} M_{\text{Pl}}^2} \log \left(a(t) \right)$$

E. O. Kahya, 1, * V. K. Onemli, 2, † and R. P. Woodard 3, ‡

ies Institut, Friedrich-Schiller-Universität Jena, Max-Wien-Platz 1, Dent of Physics, Istanbul Technical University, Maslak, Istanbul 34469, partment of Physics, University of Florida, Gainesville, FL 32611, 1

it on the recent arguments by Senatore and Zaldarriaga that loop corr cannot grow with time after first horizon crossing. We first emphasic

- · Forgotten to renormalize the unperturbed history...
- · Indeed if you do not...
- · Suppose you have a different cc that what you expected

- .
$$H_{\text{true}}^2 = H_{\text{tree}}^2 + \frac{\delta \Lambda}{M_{\text{Pl}}^2}$$

$$a_{\rm true} = e^{\rho_{\rm true}} = e^{\rho_{\rm true} + \zeta} \qquad \Rightarrow \qquad H_{\rm true} = H_{\rm tree} + \dot{\zeta} \qquad \Rightarrow \qquad \dot{\zeta} \sim \frac{\delta \Lambda}{M_{\rm Pl}^2 H}$$

Tadpole!

· Effect on correlation function

Woodard's claim

- · Effect of correlation function
 - Find mass term for

$$\langle \zeta_k^2 \rangle_{\rm 1-loop} \sim \langle \zeta_k^2 \rangle_{\rm tree} \frac{H^4}{\dot{H} M_{\rm Pl}^2} \log{(a(t))}$$

E. O. Kahva, 1, * V. K. Onemli, 2, † and R. P. Woodard 3, ‡

ves Institut, Friedrich-Schüller-Universität Jena, Max-Wien-Platz 1, Dmt of Physics, Istanbul Technical University, Maslak, Istanbul 34469, partment of Physics, University of Florida, Gainesville, FL 32612, 8

it on the recent argume is by Senatore and Zaidarriaga that loop corn cannot grow with time after new best and the work with time after new best and the contract of the contr

$$m^2 \sim \frac{\delta \Lambda}{M_{\rm Pl}^2} \qquad \Rightarrow \qquad H\dot{\zeta} \sim \frac{\delta \Lambda}{M_{\rm Pl}^2} \zeta \qquad \Rightarrow \qquad \dot{\zeta} \sim \frac{\delta \Lambda}{M_{\rm Pl}^2 H} \zeta \qquad \Rightarrow \qquad \langle \zeta_k^2 \rangle_{\rm 1-loop} \sim \langle \zeta_k^2 \rangle_{\rm tree} \frac{H^2}{M_{\rm Pl}^2} \log \left(a(t)\right) = \frac{\delta \Lambda}{M_{\rm Pl}^2} \gamma_{\rm pl} = \frac{\delta \Lambda}{M$$

- · Second Woodard's mistake:
 - you can not neglect time derivatives.

$$-\int d^3x \sqrt{-g} \delta \Lambda \quad \Rightarrow \quad \int d^3x a^3 e^{3\zeta} (1+\delta N) \delta \Lambda \sim \int d^3x a^3 (3\zeta + \frac{\dot{\zeta}}{H}) \delta \Lambda \sim \int d^3x \frac{\partial \left(a^3\zeta\right)}{\partial t} \frac{\delta \Lambda}{H}$$

Woodard has only this

coupling slow roll suppressed

 $\delta \Lambda \sim H^4$

- Summary
 - take into account of time derivatives, then take into account of tadpoles, result

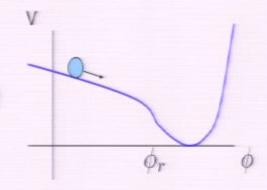

IR logs: just projection effects

log(kL) IR logs and their zero physical effect

Large IR logs log(kL)

Single Field Slow-Roll Inflation (assumption on dynamics)

$$\langle \zeta_k^2 \rangle \sim \left. \frac{H^4}{\dot{\phi}^2} \right|_{t_{h.c.}} \quad \text{where} \quad \frac{k}{a(t_{h.c})} \sim H(t_{h.c.})$$

- · Possible Infrared Effects:
 - Modes emitted earlier can change the position on the potential at horizon crossing

$$\langle \delta \phi(\vec{x}, t)^2 \rangle \sim H^3 t \sim H^2 N_{beginning}$$

- But this is all of its effect on the dynamics as:

$$ds^{2} = -dt^{2} + a(t)^{2}e^{2\zeta_{B}}dx^{2}$$

$$\downarrow \qquad \qquad \downarrow \qquad \uparrow$$

$$\langle \zeta(\vec{x}_{1}, t)\zeta(\vec{x}_{2}, t)\rangle_{B} = \langle \zeta(e^{-\zeta_{B}}\vec{x}_{1}, t)\zeta(e^{-\zeta_{B}}\vec{x}_{2}, t)\rangle_{0}$$

≅FRW
×

 $\sim dS$

t +

- By Taylor expanding

$$\begin{split} \langle \zeta_k \rangle_B &= \langle \zeta_B^2 \rangle \frac{\partial^2 \left[k^3 \langle \zeta_k^2 \rangle \right]}{\partial \log(k)^2} = \widetilde{\langle \zeta \rangle}^2 N_{\text{beginning}} \left((n_s - 1)^2 + \alpha \right) \langle \zeta_k \rangle^2 \\ &\qquad \qquad \widetilde{\langle \zeta^2 \rangle} \sim 10^{-10} \end{split}$$

log(kL) Technical point: missing running diagram

- Cut-In-the-Middle diagrams: Each mode interacts once

$$\langle \zeta^{(2)}\zeta^{(2)}\rangle_{1-\text{loop}}$$

$$\zeta_L \times \times \zeta_L$$

$$\zeta^{(2)}(t) = G(t-t')\zeta^{(1)}(t')^2 \qquad \frac{\zeta_S}{t_1} \qquad \frac{\zeta_S}{t_1}$$

$$t_1 \times \zeta_S$$
 • This gives the tilt squared $(n_s-1)^2$
$$\zeta_S \times \zeta_S$$

- Cut-In-the-Side diagrams: One mode interacts twice

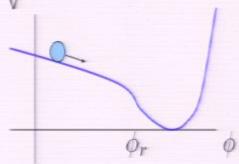

$$\langle \zeta^{(3)} \zeta^{(1)} \rangle_{1-\text{loop}} \qquad \qquad \zeta_L \qquad \zeta_L \qquad \zeta_L \qquad \zeta_S \qquad \qquad \zeta_S \qquad$$

ullet This gives the running $\ lpha$

Large IR logs $\log(kL) = 0$, physically

Single Field Slow-Roll Inflation: no dynamical effect

$$\langle \zeta_k^2 \rangle \sim \left. \frac{H^4}{\dot{\phi}^2} \right|_{t_{h.c.}} \quad \text{where} \quad \frac{k}{a(t_{h.c})} \sim H(t_{h.c.})$$

$$\Longrightarrow \langle \zeta_k \rangle_B = \langle \zeta_B^2 \rangle \frac{\partial^2 \left[k^3 \langle \zeta_k^2 \rangle \right]}{\partial \log(k)^2} = \widetilde{\langle \zeta \rangle}^2 N_{\text{beginning}} \left((n_s - 1)^2 + \alpha \right) \langle \zeta_k \rangle^2$$

- measures a distance $\Delta r(t_{\rm rh})$
- ask when mode came out of the horizon:
 - · Since a background mode is equal to a rescaling of scale factor

$$ds^2 = -dt^2 + a(t)^2 e^{2\zeta_B} dx^2$$

• We have
$$\Delta r(t) = \frac{e^{\zeta(x,t)}a(t)}{e^{\zeta(x,t_{\rm rh})}a(t_{\rm rh})} \Delta r(t_{\rm rh}) = e^{\zeta(x,t)-\zeta(x,t_{\rm rh})} \frac{a(t)}{a(t_{\rm rh})} \Delta r(t_{\rm rh})$$

· Longer modes cancel exactly!

 $\zeta(x, t_{rh}) = \int d^3k \, \zeta_k(t_{rh})$

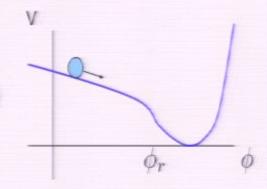

· In every realization! (no average needed)

log(kL) IR logs and their zero physical effect

Large IR logs log(kL)

Single Field Slow-Roll Inflation (assumption on dynamics)

$$\langle \zeta_k^2 \rangle \sim \left. \frac{H^4}{\dot{\phi}^2} \right|_{t_{h.c.}} \quad \text{where} \quad \frac{k}{a(t_{h.c})} \sim H(t_{h.c.})$$

- Possible Infrared Effects:
 - Modes emitted earlier can change the position on the potential at horizon crossing

$$\langle \delta \phi(\vec{x}, t)^2 \rangle \sim H^3 t \sim H^2 N_{beginning}$$

- But this is all of its effect on the dynamics as:

$$ds^{2} = -dt^{2} + a(t)^{2}e^{2\zeta_{B}}dx^{2}$$

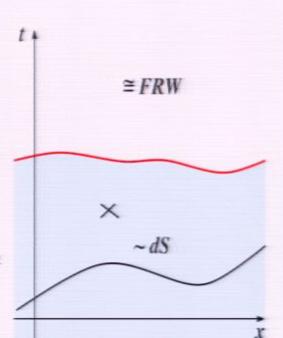

$$\downarrow \qquad \uparrow$$

$$\xi_{1}, t)\zeta(\vec{x}_{2}, t)\rangle_{B} = \langle \zeta(e^{-\zeta_{B}}\vec{x}_{1}, t)\zeta(e^{-\zeta_{B}}\vec{x}_{2}, t)\rangle_{C}$$

 $\langle \zeta(\vec{x}_1, t)\zeta(\vec{x}_2, t)\rangle_B = \langle \zeta(e^{-\zeta_B}\vec{x}_1, t)\zeta(e^{-\zeta_B}\vec{x}_2, t)\rangle_0$

- By Taylor expanding

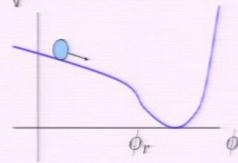

$$\begin{split} \langle \zeta_k \rangle_B &= \langle \zeta_B^2 \rangle \frac{\partial^2 \left[k^3 \langle \zeta_k^2 \rangle \right]}{\partial \log(k)^2} = \widetilde{\langle \zeta \rangle}^2 N_{\text{beginning}} \left((n_s - 1)^2 + \alpha \right) \langle \zeta_k \rangle^2 \\ &\qquad \qquad \widetilde{\langle \zeta^2 \rangle} \sim 10^{-10} \end{split}$$

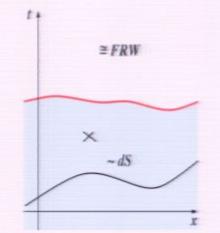

Large IR logs $\log(kL) = 0$, physically

Single Field Slow-Roll Inflation: no dynamical effect

$$\langle \zeta_k^2 \rangle \sim \left. \frac{H^4}{\dot{\phi}^2} \right|_{t_{h.c.}} \quad \text{where} \quad \frac{k}{a(t_{h.c})} \sim H(t_{h.c.})$$

$$\implies \langle \zeta_k \rangle_B = \langle \zeta_B^2 \rangle \frac{\partial^2 \left[k^3 \langle \zeta_k^2 \rangle \right]}{\partial \log(k)^2} = \widetilde{\langle \zeta \rangle}^2 N_{\text{beginning}} \left((n_s - 1)^2 + \alpha \right) \langle \zeta_k \rangle^2$$

- · Let us concentrate on what an observer measures:
 - measures a distance $\Delta r(t_{\rm rh})$
 - ask when mode came out of the horizon:
 - · Since a background mode is equal to a rescaling of scale factor

$$ds^2 = -dt^2 + a(t)^2 e^{2\zeta_B} dx^2$$

• We have
$$\Delta r(t) = \frac{e^{\zeta(x,t)}a(t)}{e^{\zeta(x,t_{\rm rh})}a(t_{\rm rh})} \Delta r(t_{\rm rh}) = e^{\zeta(x,t)-\zeta(x,t_{\rm rh})} \frac{a(t)}{a(t_{\rm rh})} \Delta r(t_{\rm rh})$$

- · Longer modes cancel exactly!
- · In every realization! (no average needed)

$$\zeta(x, t_{rh}) = \int d^3k \; \zeta_k(t_{rh})$$

Second projection effect: a Physical IR one

Large IR logs $\log(kL) = 0$, physically

Single Field Slow-Roll Inflation: no dynamical effect

$$\langle \zeta_k^2 \rangle \sim \left. \frac{H^4}{\dot{\phi}^2} \right|_{t_{h.c.}} \quad \text{where} \quad \frac{k}{a(t_{h.c})} \sim H(t_{h.c.})$$

$$\phi_r$$

$$\implies \langle \zeta_k \rangle_B = \langle \zeta_B^2 \rangle \frac{\partial^2 \left[k^3 \langle \zeta_k^2 \rangle \right]}{\partial \log(k)^2} = \langle \widetilde{\zeta} \rangle^2 N_{\text{beginning}} \left((n_s - 1)^2 + \alpha \right) \langle \zeta_k \rangle^2$$

- · Let us concentrate on what an observer measures:
 - measures a distance $\Delta r(t_{\rm rh})$
 - ask when mode came out of the horizon:
 - Since a background mode is equal to a rescaling of scale factor

$$ds^2 = -dt^2 + a(t)^2 e^{2\zeta_B} dx^2$$

• We have
$$\Delta r(t) = \frac{e^{\zeta(x,t)}a(t)}{e^{\zeta(x,t_{\rm rh})}a(t_{\rm rh})} \Delta r(t_{\rm rh}) = e^{\zeta(x,t)-\zeta(x,t_{\rm rh})} \frac{a(t)}{a(t_{\rm rh})} \Delta r(t_{\rm rh})$$

- · Longer modes cancel exactly!
- · In every realization! (no average needed)

$$\zeta(x, t_{rh}) = \int d^3k \, \zeta_k(t_{rh})$$

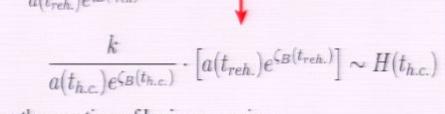

Second projection effect: a Physical IR one

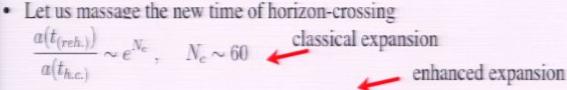

A Physical IR effect

• If we do not see the gradients of ζ_B , we do not observe ζ_B

$$\langle \zeta_k^2 \rangle \sim \left. \frac{H^4}{\dot{\phi}^2} \right|_{t_{h.c.}}$$
 where $\left. \frac{k}{a(t_{h.c})} \right|_{H(t_{h.c.})}$

• Since $k_{phys.}^{us} = \frac{k}{a(t_{reh.})e^{\zeta_B(t_{reh})}}$

$$\langle e^{\zeta_B(t_{reh.})-\zeta_B(t_{h.c.})}\rangle \sim 1+\langle \zeta(x)^2\rangle_{t_{reh.}}^{t_{h.c.}} \sim 1+\widetilde{\langle \zeta^2\rangle}N_c$$

$$\widetilde{\langle \zeta^2 \rangle} \sim 10^{-10}$$

We have

$$k e^{N_c(1+\widetilde{\langle \zeta^2 \rangle})} = H(t_{h.c.}) \quad \Rightarrow \quad \delta N \sim \widetilde{\langle \zeta^2 \rangle} N_c$$

· True IR (tiny) effect:

$$\langle \ell_s^2 \rangle \sim \frac{H^4}{2} \left(1 + (n_s - 1) N_s \widetilde{\ell_s^2} \right)$$

 $\cong FRW$

 $\sim dS$

 $k_{phys}(t_{reh.})^{-1}$

Time of horizon crossing

 $H^{-1}(\text{now})$

X

First issue

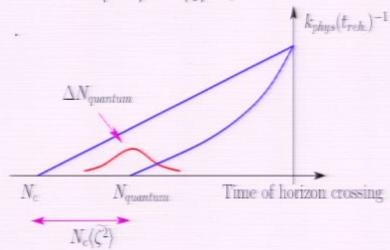

Why did we took the average of the enhanced expansion?

 $\langle \delta N \rangle \sim \widetilde{\langle \zeta \rangle} N_c$

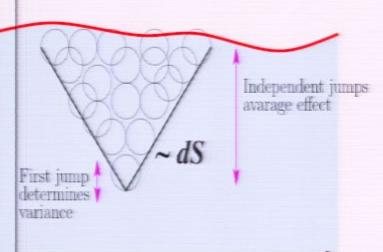

- Small variance:

t +

$$\langle \Delta N_{quantum}^2 \rangle^{1/2} \sim \widetilde{\langle \zeta^2 \rangle}^{1/2}$$

 $\cong FRW$

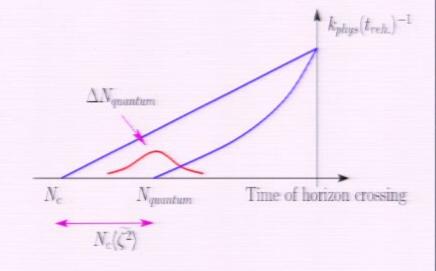

Second issue

- Enhanced expansion $\delta N_{quantum} \sim N_c \langle \zeta^2 \rangle$
 - What happens for $\widetilde{\langle \zeta^2 \rangle} \sim 1$ (Close to Eternal Inflation)? or very large N_c ?
- · Non-perturbative treatment necessary
 - Already done! in With Dubovsky and Villadoro JHEP0904:118,2009

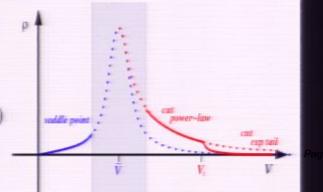

$$\langle V \rangle = \langle e^{3\zeta_B} \rangle \simeq e^{3N_c \frac{2}{1 + \sqrt{1 - 1/\Omega}}}$$

$$\Omega \equiv \frac{2\pi^2}{3} \frac{\dot{\phi}^2}{H^4} \sim 1/\widetilde{\langle \zeta^2 \rangle}$$

- Maximum enhancement: $\delta N_{quantum}^{max} \simeq N_e/2$,
- Small variance $\langle \Delta N_{quantum}^2 \rangle^{1/2} \sim \widetilde{(\zeta^2)}^{1/2}$
- Probability distribution known (also within eternal inflation)

$$\rho(V,\tau) \approx N_e^{-\Omega \left[\frac{3N}{2}\left(1+\sqrt{1-\frac{1}{\Omega}}\right)-3N_c\right]^2}$$

Dynamical effects
(it matters only the period of horizon crossing)

On Loops In Inflation

- We have learnt how to compute quantum corrections to inflationary observables.
- UV divergency
 - The logarithmic running is of the form $\log \left(\frac{H}{\mu}\right)$
- IR divergency in Single Field Inflaton:
 - need to renormalize the unperturbed history
 - need to take into account projection effects:
 - -There is no time dependence
 - -and no non-trivial scale dependence $\log(kL)$
 - -There is a physical enhanced expansion $\delta N_{quantum} \sim N_c \langle \widetilde{\zeta}^2 \rangle$
- · The predictivity of inflation is fine
- · Eternal Inflation is true
