

Title: Quantum Information Review - Lecture 4

Date: Feb 17, 2011 09:00 AM

URL: <http://pirsa.org/11020036>

Abstract:

superposition  $|01\rangle + |10\rangle$   
 can put into ions in traps

Liquid-state

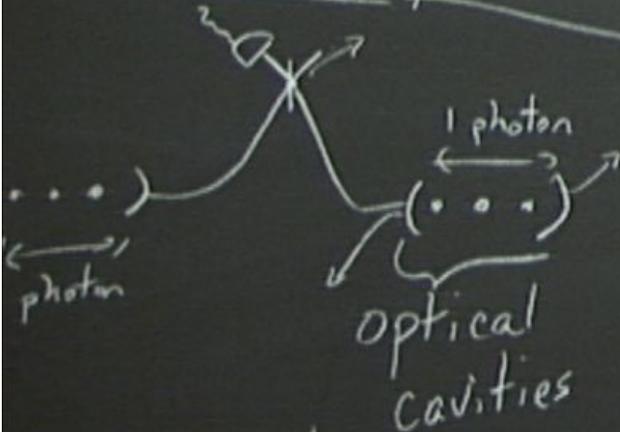

NMR: Each molecule  
is a quantum computer.

Qubits are nuclear spins.

Interact w/ in a molecule,  
but we turn them off

w/ RF pulses.

At room  
temperature,  
polarizations  $\sim 10^{-4}$  or  
 $10^{-6} \rightarrow$   
pseudopure states

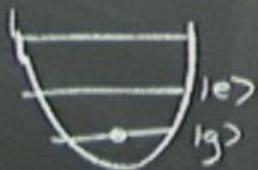

Superposition  $|01\rangle + |10\rangle$   
can put into ions in traps

each molecule  
 quantum computer.  
 nuclear spins.  
 in a molecule,  
 spin then off  
 w/ RF pulses.

At room  
 temperature,  
 polarizations  $\sim 10^{-4}$  or  
 $10^{-6} \Rightarrow$   
 pseudopure states

## Quantum Dots:

Well of  
 "artificial  
 semiconductor  
 atom"

$|0\rangle$  &  $|1\rangle$

But spin of electron is  
 much more isolated  
 electron in ground state  
 $|0\rangle = |\downarrow\rangle, |1\rangle = |\uparrow\rangle$

Could use  
 $|g\rangle$  &  $|e\rangle$  as  
 - decohere fast.

electron is  
 isolated  
 ground state

## Optical QC:

Qubits are photons.

Linear optics manipulations.

- To get a universal set of quantum gates, one option is to use non-linear optics.
- Can do universal QC w/ linear optics using measurement & feedback.

- Cluster states (one-way QC):  
Create big entangled state - doesn't depend on computation  
Do a series of single-qubit measurements (adaptively)  
( $\Rightarrow$ ) can get universal QC

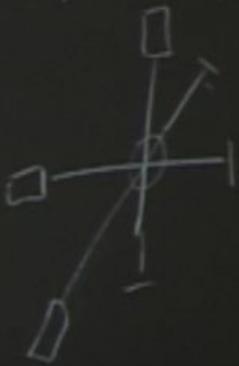

Need:

① accurate source of single photons

② high-quality photodetectors

## Optical lattice:

3 standing waves of light  
atoms get trapped at  
lattice points.

## Optical lattice:

3 standing waves of light  
atoms get trapped at  
lattice points.

Different polarizations  
of laser light interact  
differently w/ different  
states of electron in atom.  
By shifting lattice for one  
polarization, can cause state-  
dependent collisions.

- Hard to control individual atoms.
- Use cluster states?
- Build quantum simulators.

ce:  
 light  
 pped at  
 ent polarizations  
 r light interact  
 ty w/ different  
 of electron in atom.  
 lattice for one  
 can cause state.  
 collisions

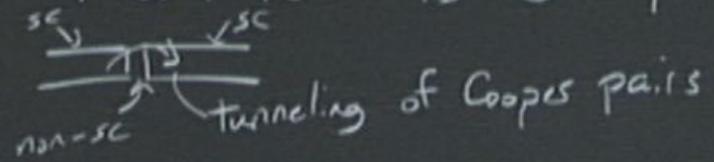

- Hard to control individual atoms.
- Use cluster states?
- Build quantum simulators.

evidence for Atoms

Molecules?

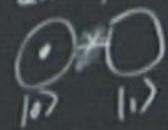

Superconductors:

- Main tool is Josephson junction

Many kinds:

Charge qubits. Location of an extra Cooper pair is qubit

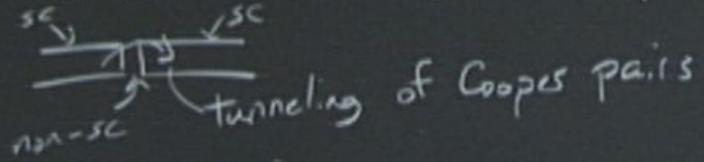

evidence  
for Atoms

of molecules?

control atoms.  
cluster states.  
quantum simulators.

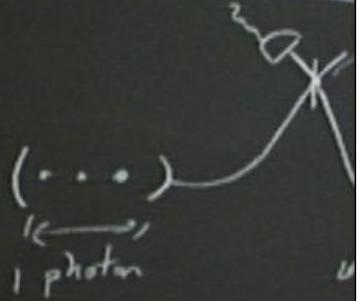

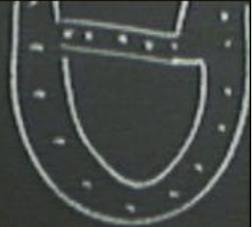

### Superconductors:

- Main tool is Josephson junction

### Many kinds:

- Charge qubits: Location of an extra Cooper pair is qubit  
Charge decoheres more rapidly
- Flux qubit: Direction of flux through ring is qubit
- Phase qubits: Qubit is phase change around ring

Superposition  
can put

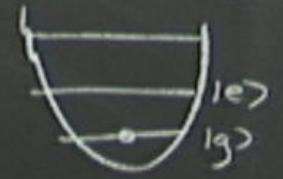

Two qubit gates done  
use Josephson junctions,  
which act non-linear inductors

- Put superconducting wells  
in microwave waveguides.

Can interact superconducting  
qubits w/ RF field.

## Quantum

Well of  
"artificial"

$|0\rangle$  &  $|1\rangle$

But spin of  
much more  
electron in  
 $|0\rangle = |\downarrow\rangle, |1\rangle =$

For two-qubit  
Pauli exclusion
