

Title: Looking for Cosmic Strings in New Observational Windows

Date: Aug 10, 2011 02:00 PM

URL: <http://pirsa.org/11080020>

Abstract: Cosmic strings are predicted to arise in both inflationary and non-inflationary cosmological models. The signatures of such strings will stand out particularly well at higher redshifts. I will discuss how to look for these signatures in CMB redshift and polarization maps and in 21cm redshift surveys.

Cosmic Strings

R. Brandenberger

Introduction

Cosmic String Review

Kaiser-Stebbins Effect and Cosmic String Wakes

Signatures of Cosmic Strings in CMB Polarization

Signatures of Cosmic Strings in 21cm Maps

Conclusions

- Cosmic strings are characterized by their **tension** μ which is associated with the energy scale η at which the strings form ($\mu \sim \eta^2$).
- Searching for the signatures of cosmic strings is a **tool to probe physics beyond the Standard Model** at energy ranges complementary to those probed by the LHC.
- Cosmic strings are constrained from cosmology: strings with a tension which exceed the value $G\mu \sim 3 \times 10^{-7}$ are in conflict with the observed acoustic oscillations in the CMB angular power spectrum.
- Existing **upper bound** on the string tension rules out large classes of particle physics models.

It is interesting to find ways to possibly **lower the bounds** on the string tension.

Conclusions

Important lessons from this talk:

- Cosmic strings → **nonlinearities** already at **high redshifts**.
- Signatures of cosmic strings **more pronounced** at **high redshifts**.
- Cosmic strings lead to perturbations which are **non-Gaussian**.
- Cosmic strings predict specific geometrical patterns in **position space**.
- **21 cm surveys** provide an ideal arena to look for cosmic strings (R.B., R. Danos, O. Hernandez and G. Holder, 2010).

- **Vacuum manifold** \mathcal{M} : set up field values which minimize V .
- At high temperature: $\phi = 0$.
- At low temperature: $|\phi| = \eta$ - but not at all \mathbf{x} .
- **Cosmic string core**: points with $|\phi| \ll \eta$.
- Criterion for the existence of cosmic strings:
 $\Pi_1(\mathcal{M}) \neq \infty$.

Cosmic String II

Cosmic Strings

R. Brandenberger

Introduction

Cosmic String Review

Kaiser-Stebbins Effect and Cosmic String Wakes

Signatures of Cosmic Strings in CMB Polarization

Signatures of Cosmic Strings in 21cm Maps

Conclusions

Symmetric cosmic string configuration (uniform along z axis, with core at $\rho = 0$):

$$\begin{aligned}\phi(\rho, \theta) &= f(\rho)\eta e^{i\theta} \\ f(\rho) &\rightarrow 1 \text{ for } \rho > w \\ f(\rho) &\rightarrow 0 \text{ for } \rho < w\end{aligned}$$

Important features:

- **Width** $w \sim \lambda^{-1/2}\eta^{-1}$
- **Mass per unit length** $\mu \sim \eta^2$ (independent of λ).

Wakes

Signatures of
Cosmic
Strings in
CMB
Polarization

Signatures of
Cosmic
Strings in
21cm Maps

Conclusions

Pirsa: 11080020

Causality → network of cosmic strings persists at all times.

Correlation length $\xi(t) < t$ for all times $t > t_c$.

Dynamics of $\xi(t)$ is governed by a Boltzmann equation which describes the transfer of energy from long strings to string loops

Scaling Solution II

R. H. Brandenberger, Int. J. Mod. Phys. A **9**, 2117 (1994)
[arXiv:astro-ph/9310041].

Cosmic
Strings in
CMB
Polarization

Signatures of
Cosmic
Strings in
21cm Maps

Conclusions

Analysis of the Boltzmann equation shows that $\xi(t) \sim t$ for all $t > t_c$:

- If $\xi(t) \ll t$ then rapid loop production and $\xi(t)/t$ increases.
- If $\xi(t) \gg t$ then no loop production and $\xi(t)/t$ decreases.

History I

Cosmic Strings

R. Brandenberger

Introduction

Cosmic String Review

Kaiser-Stebbins Effect and Cosmic String Wakes

Signatures of Cosmic Strings in CMB Polarization

Signatures of Cosmic Strings in 21cm Maps

Conclusions

- Cosmic strings were popular in the 1980's as an **alternative to inflation** for producing a scale-invariant spectrum of cosmological perturbations.
- Cosmic strings lead to **incoherent** and **active** fluctuations (rather than coherent and passive like in inflation).
- Reason: strings on super-Hubble scales are entropy fluctuations which seed an adiabatic mode which is growing until Hubble radius crossing.
- Boomerang CMB data (1999) on the acoustic oscillations in the CMB angular power spectrum rules out cosmic strings as the main source of fluctuations..
- Interest in cosmic strings collapses.

History II

R. Brandenberger

Introduction

Cosmic String Review

Kaiser-Stebbins Effect and Cosmic String Wakes

Signatures of Cosmic Strings in CMB Polarization

Signatures of Cosmic Strings in 21cm Maps

Conclusions

Pirsa: 11080020

- **Supergravity models of inflation** typically yield cosmic strings after reheating (R. Jeannerot et al., 2003).
- **Brane inflation models** typically yield cosmic strings in the form of **cosmic superstrings** (Sarangi and Tye, 2002; Copeland, Myers and Polchinski, 2004).
- **String Gas Cosmology** may lead to a remnant scaling network of cosmic superstrings (R.B. and C. Vafa, 1989; A. Nayeri, R.B. and C. Vafa, 2006).
- → renewed interest in cosmic strings as supplementary source of fluctuations.
- Best current limit from angular spectrum of CMB anisotropies: $\sim 10\%$ of the total power can come from strings (see e.g. Wyman, Pogosian and Wasserman, 2005).
- Leads to limit $G\mu < 3 \times 10^{-7}$.

Introduction

Cosmic String Review

Kaiser-Stebbins Effect and Cosmic String Wakes

Signatures of Cosmic Strings in CMB Polarization

Signatures of Cosmic Strings in 21cm Maps

Conclusions

Pirsa: 11080020

- **Supergravity models of inflation** typically yield cosmic strings after reheating (R. Jeannerot et al., 2003).
- **Brane inflation models** typically yield cosmic strings in the form of **cosmic superstrings** (Sarangi and Tye, 2002; Copeland, Myers and Polchinski, 2004).
- **String Gas Cosmology** may lead to a remnant scaling network of cosmic superstrings (R.B. and C. Vafa, 1989; A. Nayeri, R.B. and C. Vafa, 2006).
- → renewed interest in cosmic strings as supplementary source of fluctuations.
- Best current limit from angular spectrum of CMB anisotropies: $\sim 10\%$ of the total power can come from strings (see e.g. Wyman, Pogosian and Wasserman, 2005).
- Leads to limit $G\mu < 3 \times 10^{-7}$.

- network of line discontinuities in CMB anisotropy maps.
- Characteristic scale: comoving Hubble radius at the time of recombination → need good angular resolution to detect these edges.
- Need to analyze position space maps.
- Edges produced by cosmic strings are masked by the “background” noise.
- Edge detection algorithms**: a promising way to search for strings
- Application of **Canny edge detection algorithm** to simulated data (SPT/ACT specification) → limit $G\mu < 2 \times 10^{-8}$ may be achievable [S. Amsel, J. Berger and R.B. (2007), A. Stewart and R.B. (2008), R. Danos and R.B. (2008)]

A man with reddish hair is looking at a chalkboard. The chalkboard has a handwritten equation in white chalk: $P_G(k) \sim (G/k)^2$. The man is holding a yellow object, possibly a pointer or a piece of chalk, in his right hand.

$$P_G(k) \sim (G/k)^2$$

$$P_G(k) \sim (G_n)^2 \sim 10^{-11}$$

$$P_{GS}(k) \sim (G_{\mu})^2 \sim 10^{-11}$$

$$P_{GS}(k) \sim (G_N)^2 \sim 10^{-11}$$

$$\parallel$$

$$k^3 |S_{\Phi}(k)|^2$$

$$P_{GS}(k) \sim (G_H)^2 \sim 10^{-11}$$

$$k^3 |S_{\Phi}(k)|^2$$

Conclusions

Consider a cosmic string moving through the primordial gas:

Wedge-shaped region of overdensity 2 builds up behind the moving string: **wake**.

$$\delta\rho = 4\pi G\mu v\gamma(v)$$

A diagram showing a cosmic string moving to the right, indicated by an arrow. The string is represented by a vertical line with a small circle at its base. Two lines diverge from the string's path, forming a wedge shape behind it. The region between these lines is shaded with diagonal lines, representing the wake. The string is moving through a medium, indicated by small circles representing gas particles.

Cosmic String
Review

Kaiser-
Stebbins
Effect and
Cosmic String
Wakes

Signatures of
Cosmic
Strings in
CMB
Polarization

Signatures of
Cosmic
Strings in
21cm Maps

Conclusions

- Initial overdensity → **gravitational accretion** onto the wake.
- Accretion computed using the Zeldovich approximation.
- Focus on a mass shell a **physical distance** $w(q, t)$ above the wake:

$$w(q, t) = a(t)(q - \psi),$$

- Gravitational accretion → ψ grows.
- Turnaround:** $\dot{w}(q, t) = 0$ determines $q_{nl}(t)$ and thus the thickness of the gravitationally bound region.

Conclusions

- Wake is a region of enhanced free electrons.
- CMB photons emitted at the time of recombination acquire **extra polarization** when they pass through a wake.
- Statistically an **equal strength of E-mode and B-mode polarization** is generated.
- Consider photons which at time t pass through a string segment laid down at time $t_i < t$.

$$\frac{P}{Q} \simeq \frac{24\pi}{25} \left(\frac{3}{4\pi}\right)^{1/2} \sigma_T f G \mu v_s \gamma_s \\ \times \Omega_B \rho_c(t_0) m_p^{-1} t_0 (z(t) + 1)^2 (z(t_i) + 1)^{1/2}.$$

Conclusions

- Cosmic strings produce direct B-mode polarization.
- → gravitational waves not the only source of primordial B-mode polarization.
- Cosmic string loop oscillations produce a scale-invariant spectrum of primordial gravitational waves with a contribution to $\delta T/T$ which is comparable to that induced by scalar fluctuations (see e.g. A. Albrecht, R.B. and N. Turok, 1986).
- → a detection of gravitational waves through B-mode polarization is more likely to be a sign of something different than inflation.

Conclusions

- N.B. **String Gas Cosmology** produces a spectrum of gravitational waves with an amplitude larger than in many single field inflation models and with a small **blue tilt**.
- Inflationary cosmology must produce a red tilt.
- Observing a blue tilt of the gravitational wave spectrum would falsify inflationary cosmology.
- B-mode polarization may be the holy grail of early universe cosmology, but not of inflation.

Motivation

R.B., D. Danos, O. Hernandez and G. Holder, arXiv:1006.2514; O. Hernandez, Yi Wang, R.B. and J. Fong, arXiv:1104.3337.

Cosmic String Review

Kaiser-Stebbins Effect and Cosmic String Wakes

Signatures of Cosmic Strings in CMB Polarization

Signatures of Cosmic Strings in 21cm Maps

Conclusions

- 21 cm surveys: **new window** to map the high redshift universe, in particular the **"dark ages"**.
- Cosmic strings produce **nonlinear structures** at high redshifts.
- These nonlinear structures will leave **imprints in 21 cm maps**.
- 21 cm surveys provide 3-d maps → potentially more data than the CMB.
- → 21 cm surveys is a promising window to search for cosmic strings.

Conclusions

Brightness temperature:

$$T_b(\nu) = T_S(1 - e^{-\tau_\nu}) + T_\gamma(\nu)e^{-\tau_\nu},$$

Spin temperature:

$$T_S = \frac{1 + x_c}{1 + x_c T_\gamma / T_K} T_\gamma.$$

T_K : gas temperature in the wake, x_c collision coefficient

Relative brightness temperature:

$$\delta T_b(\nu) = \frac{T_b(\nu) - T_\gamma(\nu)}{1 + z}$$

Optical depth:

$$\tau_\nu = \frac{3c^2 A_{10}}{4\nu^2} \left(\frac{\hbar\nu}{k_B T_S} \right) \frac{N_{HI}}{4} \phi(\nu),$$

Frequency dispersion

$$\frac{\delta\nu}{\nu} = 2\sin(\theta) \tan \theta \frac{Hw}{c},$$

Line profile:

$$\phi(\nu) = \frac{1}{\delta\nu} \text{ for } \nu \in \left[\nu_{10} - \frac{\delta\nu}{2}, \nu_{10} + \frac{\delta\nu}{2} \right],$$

Application to Cosmic String Wakes

Cosmic
Strings

R. Branden-
berger

Wake temperature T_K :

$$T_K \simeq [20 \text{ K}] (G\mu)_6^2 (v_s \gamma_s)^2 \frac{z_i + 1}{z + 1},$$

determined by considering **thermalization** at the **shock** which occurs after turnaround when $w = 1/2 w_{\max}$ (see Eulerian hydro simulations by A. Sornborger et al, 1997).

Thickness in redshift space:

$$\begin{aligned} \frac{\delta\nu}{\nu} &= \frac{24\pi}{15} G\mu v_s \gamma_s (z_i + 1)^{1/2} (z(t) + 1)^{-1/2} \\ &\simeq 3 \times 10^{-5} (G\mu)_6 (v_s \gamma_s), \end{aligned}$$

using $z_i + 1 = 10^3$ and $z + 1 = 30$ in the second line.

Conclusions

Relative brightness temperature:

$$\begin{aligned}\delta T_b(\nu) &= [0.07 \text{ K}] \frac{x_c}{1+x_c} \left(1 - \frac{T_\gamma}{T_K}\right) (1+z)^{1/2} \\ &\sim 200 \text{ mK} \quad \text{for } z+1 = 30.\end{aligned}$$

Signal is emission if $T_K > T_\gamma$ and absorption otherwise.

Critical curve (transition from emission to absorption):

$$(G\mu)_6^2 \simeq 0.1 (v_s \gamma_s)^{-2} \frac{(z+1)^2}{z_i+1}$$

Cosmic String Review

Kaiser-Stebbins Effect and Cosmic String Wakes

Signatures of Cosmic Strings in CMB Polarization

Signatures of Cosmic Strings in 21cm Maps

Conclusions

- Cosmic strings → **nonlinearities** already at **high redshifts**.
- Signatures of cosmic strings **more pronounced** at **high redshifts**.
- Cosmic strings lead to perturbations which are **non-Gaussian**.
- Cosmic strings predict specific geometrical patterns in **position space**.
- **21 cm surveys** provide an ideal arena to look for cosmic strings.
- Cosmic string wakes produce distinct wedges in redshift space with enhanced 21cm absorption or emission.

Introduction

Cosmic String Review

Kaiser-Stebbins Effect and Cosmic String Wakes

Signatures of Cosmic Strings in CMB Polarization

Signatures of Cosmic Strings in 21cm Maps

Conclusions

- $10^3 > z > 10$: baryonic matter dominated by neutral H.
- Neutral H has hydrogen hyperfine absorption/emission line.
- String wake is a gas cloud with special geometry which emits/absorbs 21cm radiation.
- Whether signal is emission/absorption depends on the temperature of the gas cloud.
