Title: Information Flow in Computation, Logic and Physics

Date: Nov 02, 2011 02:00 PM

URL: http://pirsa.org/11110076

Abstract: Ideas about information are pervasive, yet the fundamental nature and structure of information - if indeed it has one! - remains elusive. Work done from many different perspectives, including those of physics, biology, logic, computer science, statistics, and game and decision theory, has yielded insights into various aspects of information. Could there be a comprehensive, unified theory? We shall chart a particular path, focusing on the idea of *information flow*, and show how common mathematical structures arise in the description of information flow in computer science, logic and quantum information.

Recursive definitions: fundamental in computation — and in logic and foundations of mathematics.

E.g. a recursive definition of factorial:

$$fact(n) = if \ n = 0 \ then \ 1 \ else \ n \times fact(n-1).$$

We can understand recursive definitions as fixpoints: fact = F(fact), where F is a suitable functional (acting on partial functions of natural numbers).

Zeroth approximation: $\mathbf{fact}_0 = \varnothing$. We have no information about \mathbf{fact} .

First approximation: $fact_1 = \{(0,1)\}$. We gain information about one value of fact.

Second approximation: $\mathbf{fact}_2 = \{(0,1), (1,1)\}.$

k-th approximation gives us the first k values. The *limit of the increasing* sequence of approximations gives us the whole thing — which is the *least fixpoint* of the associated functional.

Church's λ -calculus:

$$t ::= x \mid \underbrace{tu}_{application} \mid \underbrace{\lambda x. t}_{abstraction}$$

A CONTROL OF THE PARTY OF THE P

Samson Abramsky (Department of Computer Science, Information Flow: tracing a path through Logic, Comp

Pirsa: 11110076 Page 29/138

As a further illustration of the power of these ideas (elaborated in the *Domain theory* pioneered by Dana Scott), we shall apply them to something more startling.

Church's λ -calculus:

$$t ::= x \mid \underbrace{tu}_{\text{application}} \mid \underbrace{\lambda x. \, t}_{\text{abstraction}}$$

Dynamics: β -reduction

$$(\lambda x. t)u \rightarrow t[u/x]$$

Samson Abramsky (Department of Computer Science,Information Flow: tracing a path through Logic, Comp

5 / 29

As a further illustration of the power of these ideas (elaborated in the *Domain theory* pioneered by Dana Scott), we shall apply them to something more startling.

Church's λ -calculus:

$$t ::= x \mid \underbrace{tu}_{\text{application}} \mid \underbrace{\lambda x. \, t}_{\text{abstraction}}$$

Dynamics: β -reduction

$$(\lambda x. t)u \rightarrow t[u/x]$$

We can form self-application : $\omega \equiv \lambda x. xx$.

Samson Abramsky (Department of Computer Science,Information Flow: tracing a path through Logic, Comp

5 / 29

As a further illustration of the power of these ideas (elaborated in the *Domain theory* pioneered by Dana Scott), we shall apply them to something more startling.

Church's λ -calculus:

$$t ::= x \mid \underbrace{tu} \mid \underbrace{\lambda x. t}$$
 application abstraction

Dynamics: β -reduction

$$(\lambda x. t)u \rightarrow t[u/x]$$

We can form self-application : $\omega \equiv \lambda x. xx$. Hence $\Omega \equiv \omega \omega$, which diverges:

$$\Omega o \Omega o \cdots$$

Samson Abramsky (Department of Computer Science, Information Flow: tracing a path through Logic, Comp

5 / 29

As a further illustration of the power of these ideas (elaborated in the *Domain theory* pioneered by Dana Scott), we shall apply them to something more startling.

Church's λ -calculus:

$$t ::= x \mid \underbrace{tu} \mid \underbrace{\lambda x. t}$$
 application abstraction

Dynamics: β -reduction

$$(\lambda x. t)u \rightarrow t[u/x]$$

We can form self-application : $\omega \equiv \lambda x. xx$.

Hence $\Omega \equiv \omega \omega$, which *diverges*:

$$\Omega \to \Omega \to \cdots$$

Also,
$$\mathbf{Y} \equiv \lambda f \cdot (\lambda x \cdot f(xx))(\lambda x \cdot f(xx))$$
 — recursion.

$$\mathbf{Y}t \to (\lambda x. t(xx))(\lambda x. t(xx)) \to t((\lambda x. t(xx))(\lambda x. t(xx))) = t(\mathbf{Y}t).$$

We can make a mathematical model based on the same ideas of *increase of finite* pieces of information we have about the functional behaviour of an expression.

A finite piece of information is a pair (S, a), where S is a finite set of finite pieces of information, and a is a finite piece of information.

N.B. This is inductive! Need to start off with a non-empty set of 'information atoms' and build up from there.

The idea is that a function satisfies or contains the information (S, a) if, whenever it is applied to an argument which satisfies all the finite pieces of information in S, it produces a result containing the information a.

Samson Abramsky (Department of Computer Science,Information Flow: tracing a path through Logic, Comp

- There are subtle issues here. Recursion involves copying/cloning.
- E.g. $\mathbf{Y} \equiv \lambda f. (\lambda x. f(xx))(\lambda x. f(xx))$. This is also why we defined a finite piece of information to be (S, a) rather than just (a, b).
 - Diagonal arguments use diagonals $\Delta(x) = (x, x)!$ Also deeply implicated in the blow-up of computational complexity.

Samson Abramsky (Department of Computer Science,Information Flow: tracing a path through Logic, Comp

Pirsa: 11110076 Page 47/138

Reflexivity and Self-Application

As a further illustration of the power of these ideas (elaborated in the *Domain theory* pioneered by Dana Scott), we shall apply them to something more startling.

Church's λ -calculus:

$$t ::= x \mid \underbrace{tu} \mid \underbrace{\lambda x. t}$$
 application abstraction

Dynamics: β -reduction

$$(\lambda x. t)u \rightarrow t[u/x]$$

We can form self-application : $\omega \equiv \lambda x. xx$. Hence $\Omega \equiv \omega \omega$, which diverges:

$$\Omega \to \Omega \to \cdots$$

Also, $\mathbf{Y} \equiv \lambda f \cdot (\lambda x \cdot f(xx))(\lambda x \cdot f(xx))$ — recursion.

$$\mathbf{Y}t \to (\lambda x.\ t(xx))(\lambda x.\ t(xx)) \to t((\lambda x.\ t(xx))(\lambda x.\ t(xx)))$$

It extracts a fixpoint for any term!

Samson Abramsky (Department of Computer Science,Information Flow: tracing a path through Logic, Comp

The Connection to Knots

How does this connect to knots? A key conceptual insight is due to Kauffman, who saw how to recast the Jones polynomial in elementary combinatorial form in terms of his *bracket polynomial*.

The basic idea of the bracket polynomial is expressed by the following equation:

$$\left\langle \right\rangle \left\langle \right\rangle = A \left\langle \right\rangle + B \left\langle \right\rangle \left\langle \right\rangle$$

Samson Abramsky (Department of Computer Science,Information Flow: tracing a path through Logic, Comp

23 / 29

Pirsa: 11110076 Page 112/138

The Connection to Knots

How does this connect to knots? A key conceptual insight is due to Kauffman, who saw how to recast the Jones polynomial in elementary combinatorial form in terms of his *bracket polynomial*.

The basic idea of the bracket polynomial is expressed by the following equation:

$$\left\langle \begin{array}{c} \\ \\ \end{array} \right\rangle = A \left\langle \begin{array}{c} \\ \\ \end{array} \right\rangle + B \left\langle \begin{array}{c} \\ \\ \end{array} \right\rangle$$

Each over-crossing in a knot or link is evaluated to a weighted sum of the two possible planar smoothings in the Temperley-Lieb algebra. With suitable choices for the coefficients A and B (as Laurent polynomials), this is invariant under the second and third Reidemeister moves. With an ingenious choice of normalizing factor, it becomes invariant under the first Reidemeister move — and yields the Jones polynomial!

This is characterized by the equation $\mathbf{B}abc = a(bc)$.

We take A = B = C = 1 in **TL**. The interpretation of the open term

$$x: B \to C, y: A \to B, z: A \vdash x(yz): C$$

is as follows:

Computation: back to the λ -calculus

We shall consider the bracketing combinator

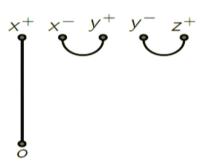

$$\mathbf{B} \equiv \lambda x. \lambda y. \lambda z. x(yz) : (B \to C) \to (A \to B) \to (A \to C).$$

This is characterized by the equation $\mathbf{B}abc = a(bc)$.

We take A = B = C = 1 in **TL**. The interpretation of the open term

$$x: B \to C, y: A \to B, z: A \vdash x(yz): C$$

is as follows:

Clark, Coecke and Sadrzadeh: Compositional Distributional Models of Meaning.

Lambek grammars: π pronoun, i infinitive, o direct object, . . .

Distributional models: words interpreted as vectors of frequency counts of co-occurrences of a set of reference words (the basis) within a fixed (small) word radius in a large text corpus. Widely used in information retrieval.

Distributional models: words interpreted as vectors of frequency counts of co-occurrences of a set of reference words (the basis) within a fixed (small) word radius in a large text corpus. Widely used in information retrieval.

These seem very different: but they have the same categorical/diagrammatic structure — vector spaces treated as in the quantum information setting!

Clark, Coecke and Sadrzadeh: Compositional Distributional Models of Meaning.

Lambek grammars: π pronoun, i infinitive, o direct object, . . .

Distributional models: words interpreted as vectors of frequency counts of co-occurrences of a set of reference words (the basis) within a fixed (small) word radius in a large text corpus. Widely used in information retrieval.

These seem very different: but they have the same categorical/diagrammatic structure — vector spaces treated as in the quantum information setting!

So we can functorially map Lambek pregroup parses into vector spaces to lift the distributional word meanings compositionally to meanings for phrases and sentences.

Implementations and benchmarks look promising: see recent work by Sadrzadeh and Graefenstette.

• Structures in monoidal categories, involving compact structure, trace etc., which support the diagrammatic calculus we have illustrated seem to provide a canonical setting for discussing *processes*. Have been widely used as such, implicitly or explicitly, in Computer Science. Recent work has emphasized their relevance in quantum information and quantum foundations. Significant links to work at PI in the Quantum Foundations group.
