

Title: Parity and the Immirzi Parameter in Lorentzian Spinfoams

Date: Nov 02, 2011 04:00 PM

URL: <http://pirsa.org/11110111>

Abstract: The parity invariance of spinfoam gravity is an open question. Naively, parity breaking should reside in the sign of the Immirzi parameter. I show that the new Lorentzian vertex formula is in fact independent of this sign, suggesting that the dynamics is parity-invariant. The situation with boundary states and operators is more complicated. I discuss parity-related pieces of the transition amplitude and graviton propagator in the large-spin 4-simplex limit. Numerical results indicate patterns similar to those in the Euclidean case. In particular, parity-related components of the graviton propagator differ by a phase. I discuss possible resolutions of this issue.

Parity and  $\delta$  in Lorentzian spinfoams
