

Title: Flavored Dark Matter: Direct Detection and Collider Signals

Date: Dec 07, 2011 11:00 AM

URL: <http://pirsa.org/11120065>

Abstract: I will present a class of models in which the dark matter particle carries flavor quantum numbers, and has renormalizable contact interactions with Standard Model fields. In particular, I will focus on models where the dark matter flavor is identified with lepton flavor in the Standard Model. The region of parameter space where the dark matter has the right abundance to be a thermal relic is accessible at current direct detection experiments. A full simulation of the signal and backgrounds, including detector effects, shows that in a significant part of parameter space these theories can be discovered above Standard Model backgrounds at the LHC. Further, flavor and charge correlations among the final state leptons might allow models of this type to be distinguished from theories where dark matter couples to leptons but does not carry flavor.

Evidence for dark matter

- Galactic rotation curves
- Cosmic Microwave Background
- Big Bang Nucleosynthesis
- Gravitational lensing observations

The WIMP Miracle

Miracle up to orders of magnitude

$$\langle \sigma_{Av} \rangle \sim \frac{\lambda^4 m_\chi^2}{32\pi m_\phi^4} \sim \frac{(0.45)^4 (100 \text{ GeV})^2}{32\pi (200 \text{ GeV})^4} \sim 3 \times 10^{-26} \text{ cm}^3/\text{s}$$

$$\sigma^{(n)} \sim \frac{\lambda^4 m_n^2}{64\pi m_\phi^4} \sim \frac{(0.45)^4 (1 \text{ GeV})^2}{64\pi (200 \text{ GeV})^4} \sim 5 \times 10^{-41} \text{ cm}^2$$

Current limits from Xenon100 experiment: 10^{-44} cm^2
 (for $m_\chi \sim 100 \text{ GeV}$)

Phenomenology

Phenomenology of FDM depends sensitively on the standard model matter fields to which the dark matter couples

- Quark FDM

- Lepton FDM

- couples with right-handed leptons
- is a Dirac fermion
- is a Standard Model singlet

$$\lambda_\alpha^i \chi^\alpha E_i^c \phi + h.c.$$

- couples with right-handed leptons
- is a Dirac fermion
- is a Standard Model singlet

$$\lambda_\alpha^i \chi^\alpha E_i^c \phi + h.c.$$

Phenomenology

Phenomenology of FDM depends sensitively on the standard model matter fields to which the dark matter couples

- Quark FDM

- Lepton FDM

- couples with right-handed leptons
- is a Dirac fermion
- is a Standard Model singlet

$$\lambda_\alpha^i \chi^\alpha E_i^c \phi + h.c.$$

Flavor structure

- Generic flavor structure mediates flavor changing processes

$$m_\mu^5 \left[\frac{e\lambda^2}{16\pi^2 m_\phi^2} \right]^2 \sim \frac{10^{-11}}{2 \mu\text{s}}$$
$$\Rightarrow \frac{\lambda}{m_\phi} \sim \frac{10^{-3}}{200 \text{ GeV}}$$

- Coupling too small to produce relic abundance
- Mediator decays promptly on collider timescales

Flavor structure

Minimal Flavor Violation

- Lepton sector of SM has a $U(3)_L \times U(3)_E$ global symmetry, broken by the Yukawa couplings

$$y_A^i L^A E_i^c H + h.c.$$

$$y_A^i : (3, \bar{3}) \text{ under } SU(3)_L \times SU(3)_E$$

- Minimal flavor violating interactions

$$\lambda_j^i = (\alpha I + \beta y^\dagger y)_j^i$$

$$[m_\chi]_i^j = (m_0 I + \Delta m y^\dagger y)_i^j$$

- Equal coupling
- Small splittings

Flavor structure

Minimal Flavor Violation

- Lepton sector of SM has a $U(3)_L \times U(3)_E$ global symmetry, broken by the Yukawa couplings

$$y_A^i L^A E_i^c H + h.c.$$

$$y_A^i : (3, \bar{3}) \text{ under } SU(3)_L \times SU(3)_E$$

- Minimal flavor violating interactions

$$\lambda_j^i = (\alpha I + \beta y^\dagger y)_j^i$$

$$[m_\chi]_i^j = (m_0 I + \Delta m y^\dagger y)_i^j$$

- Equal coupling
- Small splittings

Flavor structure

Minimal Flavor Violation

- Lepton sector of SM has a $U(3)_L \times U(3)_E$ global symmetry, broken by the Yukawa couplings

$$y_A^i L^A E_i^c H + h.c.$$

$$y_A^i : (3, \bar{3}) \text{ under } SU(3)_L \times SU(3)_E$$

- Minimal flavor violating interactions

$$\lambda_j^i = (\alpha I + \beta y^\dagger y)_j^i$$

$$[m_\chi]_i^j = (m_0 I + \Delta m y^\dagger y)_i^j$$

- Equal coupling
- Small splittings

The Model

- Choose universal coupling

$$\lambda_i^j = \lambda \mathbb{I}_i^j$$

- Choose χ_τ to be the dark matter

$$m_{\chi,e} = 90 \text{ GeV}$$

$$m_{\chi,\mu} = 90 \text{ GeV}$$

$$m_{\chi,\tau} = 70 \text{ GeV}$$

$$m_\phi = 150 \text{ GeV}$$

The Model

- Choose universal coupling

$$\lambda_i^j = \lambda \mathbb{I}_i^j$$

- Choose χ_τ to be the dark matter

$$m_{\chi,e} = 90 \text{ GeV}$$

$$m_{\chi,\mu} = 90 \text{ GeV}$$

$$m_{\chi,\tau} = 70 \text{ GeV}$$

$$m_\phi = 150 \text{ GeV}$$

- Annihilation via t-channel

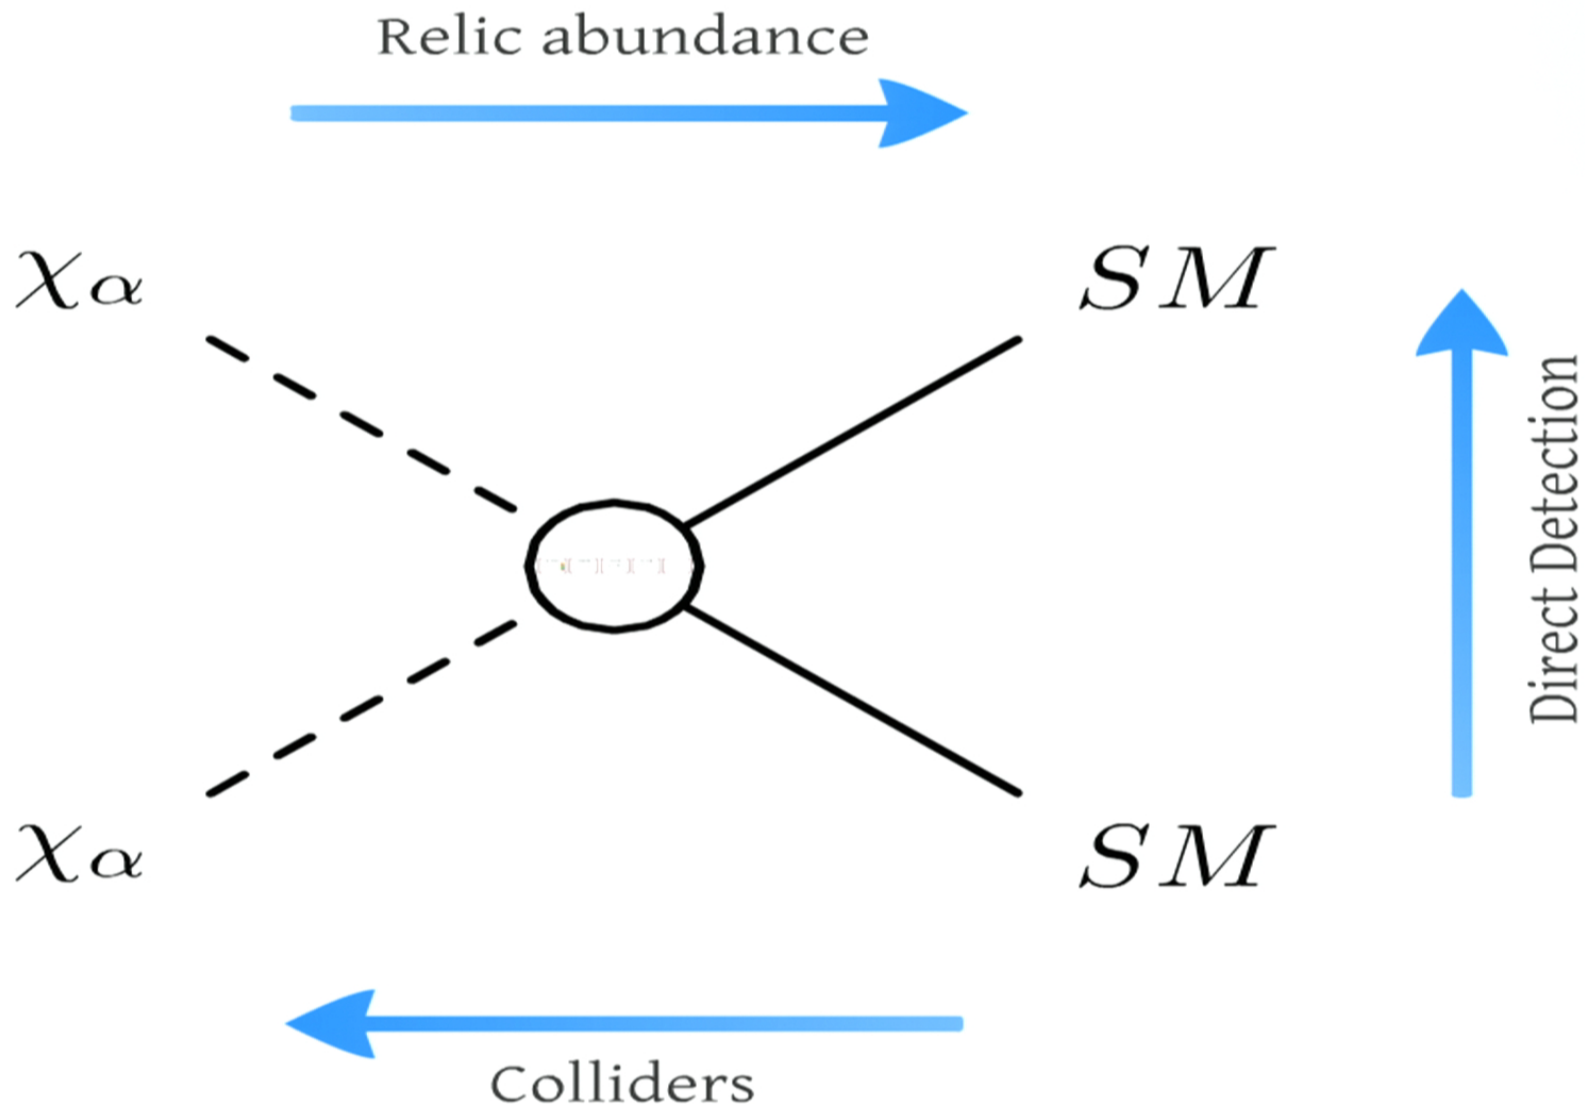

$$\langle \sigma v \rangle \approx \frac{\lambda^4 m_\chi^2}{32\pi(m_\chi^2 + m_\phi^2)^2}$$

- With additional couplings more channels open up, allowing smaller coupling values

Relic abundance

Direct Detection

Missing energy

MET > 20 GeV

Distinguishing FDM at the LHC

Can we establish that this signal above is from FDM?

Compare with "SuSy strawman models"

- Only light states are

sleptons: $\tilde{e}, \tilde{\mu}, \tilde{\tau}$
 neutralinos: χ', χ

- Same mass splittings as FDM

Conclusion

- Flavored dark matter is a simple possibility which has not been explored in a model-independent way.
- It is possible to discover and distinguish a τ FDM model at the LHC.
- Our analysis can be extended in many ways
 - Kinematic variables to identify particles in decay chains
 - Kinematic distributions: edges, end-points, m_{T2}
 - Identification of hadronically decaying taus
- Similar conclusions are expected to hold for quark-flavored dark matter. Stay tuned...

t thank you
