

Title: Inference of effective quantum models in the asymptotic regime

Date: Dec 17, 2012 04:00 PM

URL: <http://pirsa.org/12120042>

Abstract: In this talk I will sketch a project which aims at the design of systematic and efficient procedures to infer quantum models from measured data. Progress in experimental control have enabled an increasingly fine tuned probing of the quantum nature of matter, e.g., in superconducting qubits. Such experiments have shown that we not always have a good understanding of how to model the experimentally performed measurements via POVMs. It turns out that the ad hoc postulation of POVMs can lead to inconsistencies. For example, when doing asymptotic state tomography via linear inversion, one sometimes recovers density operators which are significantly not positive semidefinite. Assuming the asymptotic regime, we suggest an alternative procedure where we do not make a priori assumptions on the quantum model, i.e., on the Hilbert space dimension, the prepared states or the measured POVMs. In other words, we simultaneously estimate the dimension of the underlying Hilbert space, the quantum states and the POVMs. We are guided by Occam's razor, i.e., we search for the minimal quantum model consistent with the data.

Inference of effective quantum models in the asymptotic regime

Overview

- ▶ Setting
- ▶ Gram estimation
- ▶ Uniqueness
- ▶ Projective, non-degenerate measurements
- ◀ Summary

Setting

- States: $w \in \{1, \dots, W\}$
Measurements: $v \in \{1, \dots, V\}$
Outcomes: $k \in \{1, \dots, K\}$

$$D = \begin{pmatrix} f_{1,1,1} & f_{1,1,2} & f_{1,1,3} & f_{1,1,4} & f_{1,1,5} & f_{1,1,6} \\ f_{1,2,1} & f_{1,2,2} & f_{1,2,3} & f_{1,2,4} & f_{1,2,5} & f_{1,2,6} \\ f_{1,3,1} & f_{1,3,2} & f_{1,3,3} & f_{1,3,4} & f_{1,3,5} & f_{1,3,6} \\ f_{1,4,1} & f_{1,4,2} & f_{1,4,3} & f_{1,4,4} & f_{1,4,5} & f_{1,4,6} \\ f_{1,5,1} & f_{1,5,2} & f_{1,5,3} & f_{1,5,4} & f_{1,5,5} & f_{1,5,6} \\ f_{1,6,1} & f_{1,6,2} & f_{1,6,3} & f_{1,6,4} & f_{1,6,5} & f_{1,6,6} \end{pmatrix}$$

- Goal: find quantum model.

Setting

- ▶ States: $w \in \{1, \dots, W\}$
Measurements: $v \in \{1, \dots, V\}$
Outcomes: $k \in \{1, \dots, K\}$
- ▶ $f_{w,(vk)} = \frac{\#\{k|wv\}}{N_{wv}}$

$$D = \begin{pmatrix} f_{1,1(1)} & f_{1,1(2)} & f_{1,1(3)} & f_{1,1(4)} & f_{1,1(5)} & f_{1,1(6)} \\ f_{1,2(1)} & f_{1,2(2)} & f_{1,2(3)} & f_{1,2(4)} & f_{1,2(5)} & f_{1,2(6)} \\ f_{1,3(1)} & f_{1,3(2)} & f_{1,3(3)} & f_{1,3(4)} & f_{1,3(5)} & f_{1,3(6)} \\ f_{1,4(1)} & f_{1,4(2)} & f_{1,4(3)} & f_{1,4(4)} & f_{1,4(5)} & f_{1,4(6)} \\ f_{1,5(1)} & f_{1,5(2)} & f_{1,5(3)} & f_{1,5(4)} & f_{1,5(5)} & f_{1,5(6)} \\ f_{1,6(1)} & f_{1,6(2)} & f_{1,6(3)} & f_{1,6(4)} & f_{1,6(5)} & f_{1,6(6)} \end{pmatrix}$$

- ▶ Goal: find quantum model.

Setting

- ▶ States: $w \in \{1, \dots, W\}$
Measurements: $v \in \{1, \dots, V\}$
Outcomes: $k \in \{1, \dots, K\}$

- ▶ $f_{w,(vk)} = \frac{\#\{k|wv\}}{N_{wv}}$

- ▶ $\mathcal{D} =$
$$\begin{pmatrix} f_{1,(1,1)} & \cdots & f_{1,(1,K)} & \cdots & f_{1,(V,1)} & \cdots & f_{1,(V,K)} \\ f_{2,(1,1)} & \cdots & f_{2,(1,K)} & \cdots & f_{2,(V,1)} & \cdots & f_{2,(V,K)} \\ \vdots & & \vdots & & \vdots & & \vdots \\ f_{W,(1,1)} & \cdots & f_{W,(1,K)} & \cdots & f_{W,(V,1)} & \cdots & f_{W,(V,K)} \end{pmatrix}$$

• Goal: find quantum model.

Setting

- States: $w \in \{1, \dots, W\}$
Measurements: $v \in \{1, \dots, V\}$
Outcomes: $k \in \{1, \dots, K\}$

- $f_{w,(vk)} = \frac{\#\{k|wv\}}{N_{wv}}$

- $\mathcal{D} =$

$$\begin{pmatrix} f_{1,(1,1)} & \cdots & f_{1,(1,K)} & \cdots & f_{1,(V,1)} & \cdots & f_{1,(V,K)} \\ f_{2,(1,1)} & \cdots & f_{2,(1,K)} & \cdots & f_{2,(V,1)} & \cdots & f_{2,(V,K)} \\ \vdots & & \vdots & & \vdots & & \vdots \\ f_{W,(1,1)} & \cdots & f_{W,(1,K)} & \cdots & f_{W,(V,1)} & \cdots & f_{W,(V,K)} \end{pmatrix}$$

- Goal: find quantum model.

Setting

Some common approaches to find quantum models:¹

- State tomography²
(assumptions about $\dim(\mathcal{H})$, measurements)
- Falsification of target models, fidelity to target models³
(relation to target model; no explicit expressions)
- Dimension witnessing⁴
(lower bounds on $\dim(\mathcal{H})$)
- Confidence region estimators for state tomography⁵
(assumptions about $\dim(\mathcal{H})$, measurements)
- Self-consistent quantum process tomography⁶
(assumptions about $\dim(\mathcal{H})$, requires educated guess)

¹Quantum model = ($\dim(\mathcal{H})$, states, measurements)

Setting

- Our assumption: asymptotic limit, i.e., $N_{wv} \rightarrow \infty$,

$$f_{w,vk} \rightarrow p_{w,vk}$$

- Born's rule:

$$f_{w,vk} = \text{tr}(\rho_w E_{vk}) = \rho_w^T E_{vk}$$

- $P = (\rho_w \dots \rho_w, E_{v1} \dots E_{vK}, \dots, E_{v1} \dots E_{vK})$

- States-measurements Gram matrix

$$G = P^T P$$

$$\left(\begin{array}{c|c} G_{ss} & D \\ \hline D^T & G_{mm} \end{array} \right)$$

?

- $\text{rank}(D) = \text{rank}(G) = \text{rank}(P) = d^2$

- $\text{rank}(P_s), \text{rank}(P_m) = d^2 \Rightarrow \text{rank}(D) = d^2$

Setting

- Our assumption: asymptotic limit, i.e., $N_{wv} \rightarrow \infty$,

$$f_{w,vk} \rightarrow p_{w,vk}$$

- Born's rule:

$$f_{w,vk} = \text{tr}(\rho_w E_{vk}) = \vec{\rho}_w^T \vec{E}_{vk}$$

$$\star P = (p_{11} \dots p_{1N} \quad E_{11} \dots E_{1K} \dots E_{N1} \dots E_{NK})$$

★ States-measurements Gram matrix

$$G = P^T P$$

$$\left(\begin{array}{c|c} G_s & D \\ \hline D^T & G_m \end{array} \right)$$

?

$$\star \text{rank}(D) \leq \text{rank}(G) \leq \text{rank}(P) \leq d^2$$

$$\star \text{rank}(P_s), \text{rank}(P_m) \leq d^2 \Rightarrow \text{rank}(D) \leq d^2$$

Setting

- Our assumption: asymptotic limit, i.e., $N_{wv} \rightarrow \infty$,

$$f_{w,vk} \rightarrow p_{w,vk}$$

- Born's rule:

$$f_{w,vk} = \text{tr}(\rho_w E_{vk}) = \vec{\rho}_w^T \vec{E}_{vk}$$

- $P = (\vec{\rho}_1 | \cdots | \vec{\rho}_W | \vec{E}_{11} | \cdots | \vec{E}_{1K} | \cdots | \vec{E}_{V1} | \cdots | \vec{E}_{VK})$

← States-measurements Gram matrix

$$G = P^T P$$

$$\left(\begin{array}{c|c} G_{ss} & D \\ \hline D^T & G_{mm} \end{array} \right)$$

?

$$\Rightarrow \text{rank}(D) \leq \text{rank}(G) = \text{rank}(P) \leq d^2$$

$$\Rightarrow \text{rank}(P_{ss}), \text{rank}(P_{mm}) \leq d^2 \Rightarrow \text{rank}(D) \leq d^2$$

Handwritten notes on a chalkboard:

$$G = \begin{pmatrix} \begin{matrix} \lambda & \lambda & \lambda \\ \lambda & \lambda & \lambda \\ \lambda & \lambda & \lambda \end{matrix} & D \\ D^T & X \end{pmatrix}$$

$$G = \begin{pmatrix} X & D \\ D^T & \begin{matrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{matrix} \end{pmatrix}$$

Other notes include:

- $V=1$
- $V=2$

Overview

- ▶ Setting
- ▶ Gram estimation
- ▶ Uniqueness
- ▶ Projective, non-degenerate measurements
- ▶ Summary

Projective, non-degenerate measurements

- Recall that

$$G = \begin{pmatrix} G_{\text{st}} & \mathcal{D} \\ \mathcal{D}^T & G_{\text{m}} \end{pmatrix}$$

- ✧ Assume: measurements are projective, non-degenerate, and states are post-measurement states.
- ✧ Then, $\rho_{\text{st}} = E_{\text{st}}$ and $\rho_{\text{m}} = E_{\text{m}}$.

$$\mathcal{D} = \begin{pmatrix} \langle \psi_1 | \phi_1 \rangle & \dots & \langle \psi_1 | \phi_d \rangle \\ \vdots & \ddots & \vdots \\ \langle \psi_d | \phi_1 \rangle & \dots & \langle \psi_d | \phi_d \rangle \end{pmatrix} \quad (*)$$

Then, $\rho_{\text{st}} = E_{\text{st}}$ and $\rho_{\text{m}} = E_{\text{m}}$.

Assume $\dim(\mathcal{H}) = d$ and $(*)$. Then, $\rho_{\text{st}} = E_{\text{st}}$ and $G_{\text{st}} = \mathcal{D} = G_{\text{m}}$.

Projective, non-degenerate measurements

- Recall that

$$G = \begin{pmatrix} G_{\text{st}} & \mathcal{D} \\ \mathcal{D}^T & G_{\text{m}} \end{pmatrix}$$

- Assume: measurements are projective, non-degenerate, and states are post-measurement states.

- ★ Then, $\rho_{\text{A}} = E_{\text{A}}$ and

$$\mathcal{D} = \begin{pmatrix} \langle \psi_1 | \psi_1 \rangle & \langle \psi_1 | \psi_2 \rangle & \dots & \langle \psi_1 | \psi_d \rangle \\ \langle \psi_2 | \psi_1 \rangle & \langle \psi_2 | \psi_2 \rangle & \dots & \langle \psi_2 | \psi_d \rangle \\ \vdots & \vdots & \ddots & \vdots \\ \langle \psi_d | \psi_1 \rangle & \langle \psi_d | \psi_2 \rangle & \dots & \langle \psi_d | \psi_d \rangle \end{pmatrix} \quad (*)$$

Then, $\rho_{\text{B}} = E_{\text{B}}$ and

Assume $\dim(\mathcal{H}) = d$ and $(*)$. Then, $\rho_{\text{A}} = E_{\text{A}}$ and $G_{\text{A}} = \mathcal{D} = G_{\text{B}}$.

Projective, non-degenerate measurements

- Recall that

$$G = \begin{pmatrix} G_{\text{st}} & \mathcal{D} \\ \mathcal{D}^T & G_{\text{m}} \end{pmatrix}$$

- Assume: measurements are projective, non-degenerate, and states are post-measurement states.
- Then, $\rho_{vk} = E_{vk} \Rightarrow$

$$\mathcal{D} = \begin{pmatrix} \mathbb{I}_d & * & * \\ * & \ddots & * \\ * & * & \mathbb{I}_d \end{pmatrix}. \quad (*)$$

Then, $\rho_{vk} = E_{vk}$ and $G_{\text{st}} = D$ and $G_{\text{m}} = D^T$.

Projective, non-degenerate measurements

- Recall that

$$G = \begin{pmatrix} G_{\text{st}} & \mathcal{D} \\ \mathcal{D}^T & G_{\text{m}} \end{pmatrix}$$

- Assume: measurements are projective, non-degenerate, and states are post-measurement states.
- Then, $\rho_{vk} = E_{vk} \Rightarrow$

$$\mathcal{D} = \begin{pmatrix} \mathbb{I}_d & * & * \\ * & \ddots & * \\ * & * & \mathbb{I}_d \end{pmatrix}. \quad (*)$$

Theorem (Converse)

Assume $\dim(\mathcal{H}) = d$ and $(*)$. Then, $\rho_{vk} = E_{vk}$, and $G_{\text{st}} = \mathcal{D} = G_{\text{m}}$.

Representative density matrices and POVM elements

► [arXiv:1210.1105](#)

Summary

- ▶ Gram estimation guided by Occam's razor
 $\rightsquigarrow$ rank minimization (NP-hard)
- ▶ Convex relaxation
- ▶ Observation: $G_{\text{estimated}} \notin \{\text{quantum Gram matrices}\}$ possible.
 $\rightsquigarrow$ Uniqueness analysis (of independent interest)
- ▶ Special case: projective, non-degenerate measurements
 $\rightsquigarrow$ Representative density matrices and POVMs via a heuristic procedure.

Thank you!
