

Title: 12/13 PSI - Found Quantum Mechanics Lecture 5

Date: Jan 11, 2013 11:30 AM

URL: <http://pirsa.org/13010070>

Abstract:

Why are preparations represented by density operators?

Why are measurements represented by POVMs?

Why the Born rule? (Why a rule that's linear in the state?)

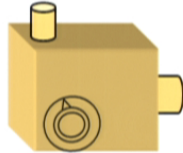

Why is composition of systems represented by tensor product?

Why Hilbert space over the complex field?

Why Hilbert space at all?

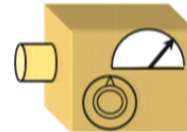

A framework for convex operational theories

$$\Pr(k|P, M) = f_{M,k}(\mathbf{s}_P) \quad \text{What can we say about } f?$$

Operational states form a convex set

Operational states form a convex set

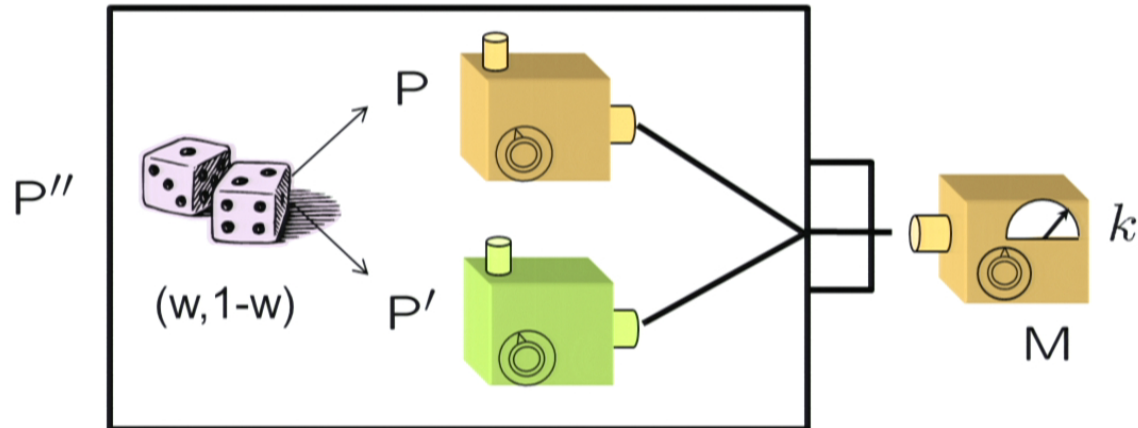

$$\forall M, k : p(k|P'', M) = w p(k|P, M) + (1-w) p(k|P', M)$$

$$f(s_{P''}) = w f(s_P) + (1-w) f(s_{P'})$$

Also true for fiducial mmts, so $s_{P''} = w s_P + (1-w) s_{P'}$

Operational states form a convex set

$$\forall M, k : p(k|P'', M) = w p(k|P, M) + (1-w) p(k|P', M)$$

$$f(\mathbf{s}_{P''}) = w f(\mathbf{s}_P) + (1-w) f(\mathbf{s}_{P'})$$

Also true for fiducial mmts, so $\mathbf{s}_{P''} = w \mathbf{s}_P + (1-w) \mathbf{s}_{P'}$

Closed under convex combination \rightarrow a convex set

$$f(w \mathbf{s}_P + (1-w) \mathbf{s}_{P'}) = w f(\mathbf{s}_P) + (1-w) f(\mathbf{s}_{P'}) \quad \text{Convex linear}$$

Convex linearity implies linearity

If f is convex linear on opt'l states

$$s = \sum_i w_i s_i \Rightarrow f(s) = \sum_i w_i f(s_i) \quad 0 \leq w_i \leq 1 \text{ and } \sum_i w_i = 1$$

Then f is linear on opt'l states

$$s = \sum_i \alpha_i s_i \Rightarrow f(s) = \sum_i \alpha_i f(s_i) \quad \alpha_i \in \mathbb{R}$$

Convex linearity implies linearity

If f is convex linear on opt'l states

$$s = \sum_i w_i s_i \Rightarrow f(s) = \sum_i w_i f(s_i) \quad 0 \leq w_i \leq 1 \text{ and } \sum_i w_i = 1$$

Then f is linear on opt'l states

$$s = \sum_i \alpha_i s_i \Rightarrow f(s) = \sum_i \alpha_i f(s_i) \quad \alpha_i \in \mathbb{R}$$

Note that the fiducial mmts are clearly represented by linear functions

$$\mathbf{s}_P = \begin{pmatrix} \Pr(\text{pass} | P, M_1) \\ \Pr(\text{pass} | P, M_2) \\ \vdots \\ \Pr(\text{pass} | P, M_K) \end{pmatrix} \quad \mathbf{r}_{M_i, \text{pass}} = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 0 \\ \vdots \end{pmatrix}$$
$$\Pr(\text{pass} | P, M_i) = \mathbf{r}_{M_i, \text{pass}} \cdot \mathbf{s}_P$$

Convex linearity implies linearity

If f is convex linear on opt'l states

$$s = \sum_i w_i s_i \Rightarrow f(s) = \sum_i w_i f(s_i) \quad 0 \leq w_i \leq 1 \text{ and } \sum_i w_i = 1$$

Then f is linear on opt'l states

$$s = \sum_i \alpha_i s_i \Rightarrow f(s) = \sum_i \alpha_i f(s_i) \quad \alpha_i \in \mathbb{R}$$

Proof:

$$s = \sum_i \alpha_i s_i$$
$$s + \sum_{j \in I_-} |\alpha_j| s_j = \sum_{i \in I_+} |\alpha_i| s_i$$

Convex linearity implies linearity

If f is convex linear on opt'l states

$$s = \sum_i w_i s_i \Rightarrow f(s) = \sum_i w_i f(s_i) \quad 0 \leq w_i \leq 1 \text{ and } \sum_i w_i = 1$$

Then f is linear on opt'l states

$$s = \sum_i \alpha_i s_i \Rightarrow f(s) = \sum_i \alpha_i f(s_i) \quad \alpha_i \in \mathbb{R}$$

Note that the fiducial mmts are clearly represented by linear functions

$$s_P = \begin{pmatrix} \Pr(\text{pass} | P, M_1) \\ \Pr(\text{pass} | P, M_2) \\ \vdots \\ \Pr(\text{pass} | P, M_K) \end{pmatrix} \quad r_{M_i, \text{pass}} = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 0 \\ \vdots \end{pmatrix}$$

$$\Pr(\text{pass} | P, M_i) = r_{M_i, \text{pass}} \cdot s_P$$

Convex linearity implies linearity

If f is convex linear on opt'l states

$$s = \sum_i w_i s_i \Rightarrow f(s) = \sum_i w_i f(s_i) \quad 0 \leq w_i \leq 1 \text{ and } \sum_i w_i = 1$$

Then f is linear on opt'l states

$$s = \sum_i \alpha_i s_i \Rightarrow f(s) = \sum_i \alpha_i f(s_i) \quad \alpha_i \in \mathbb{R}$$

Proof:

$$s = \sum_i \alpha_i s_i$$
$$s + \sum_{j \in I_-} |\alpha_j| s_j = \sum_{i \in I_+} |\alpha_i| s_i$$

Consider a coarse-graining of all the outcomes of a fiducial mmt. $1 = \sum_i \alpha_i$

Convex linearity implies linearity

If f is convex linear on opt'l states

$$s = \sum_i w_i s_i \Rightarrow f(s) = \sum_i w_i f(s_i) \quad 0 \leq w_i \leq 1 \text{ and } \sum_i w_i = 1$$

Then f is linear on opt'l states

$$s = \sum_i \alpha_i s_i \Rightarrow f(s) = \sum_i \alpha_i f(s_i) \quad \alpha_i \in \mathbb{R}$$

Note that the fiducial mmts are clearly represented by linear functions

$$\mathbf{s}_P = \begin{pmatrix} \Pr(\text{pass} | P, M_1) \\ \Pr(\text{pass} | P, M_2) \\ \vdots \\ \Pr(\text{pass} | P, M_K) \end{pmatrix} \quad \mathbf{r}_{M_i, \text{pass}} = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 0 \\ \vdots \end{pmatrix}$$
$$\Pr(\text{pass} | P, M_i) = \mathbf{r}_{M_i, \text{pass}} \cdot \mathbf{s}_P$$

Convex linearity implies linearity

If f is convex linear on opt'l states

$$s = \sum_i w_i s_i \Rightarrow f(s) = \sum_i w_i f(s_i) \quad 0 \leq w_i \leq 1 \text{ and } \sum_i w_i = 1$$

Then f is linear on opt'l states

$$s = \sum_i \alpha_i s_i \Rightarrow f(s) = \sum_i \alpha_i f(s_i) \quad \alpha_i \in \mathbb{R}$$

Proof:

$$s = \sum_i \alpha_i s_i$$
$$s + \sum_{j \in I_-} |\alpha_j| s_j = \sum_{i \in I_+} |\alpha_i| s_i$$

Consider a coarse-graining of all the outcomes of a fiducial mmt. $1 = \sum_i \alpha_i$

Convex linearity implies linearity

If f is convex linear on opt'l states

$$s = \sum_i w_i s_i \Rightarrow f(s) = \sum_i w_i f(s_i) \quad 0 \leq w_i \leq 1 \text{ and } \sum_i w_i = 1$$

Then f is linear on opt'l states

$$s = \sum_i \alpha_i s_i \Rightarrow f(s) = \sum_i \alpha_i f(s_i) \quad \alpha_i \in \mathbb{R}$$

Proof: $s = \sum_i \alpha_i s_i$
 $s + \sum_{j \in I_-} |\alpha_j| s_j = \sum_{i \in I_+} |\alpha_i| s_i$

Consider a coarse-graining of all the outcomes of a fiducial mmt. $1 = \sum_i \alpha_i$

Convex linearity implies linearity

If f is convex linear on opt'l states

$$s = \sum_i w_i s_i \Rightarrow f(s) = \sum_i w_i f(s_i) \quad 0 \leq w_i \leq 1 \text{ and } \sum_i w_i = 1$$

Then f is linear on opt'l states

$$s = \sum_i \alpha_i s_i \Rightarrow f(s) = \sum_i \alpha_i f(s_i) \quad \alpha_i \in \mathbb{R}$$

Proof:

$$s = \sum_i \alpha_i s_i$$
$$s + \sum_{j \in I_-} |\alpha_j| s_j = \sum_{i \in I_+} |\alpha_i| s_i$$

Consider a coarse-graining of all the outcomes of a fiducial mmt.

$$\begin{aligned} 1 &= \sum_i \alpha_i \\ 1 + \sum_{j \in I_-} |\alpha_j| &= \sum_{i \in I_+} |\alpha_i| \equiv \mathcal{N} \end{aligned}$$

Convex linearity implies linearity

If f is convex linear on opt'l states

$$s = \sum_i w_i s_i \Rightarrow f(s) = \sum_i w_i f(s_i) \quad 0 \leq w_i \leq 1 \text{ and } \sum_i w_i = 1$$

Then f is linear on opt'l states

$$s = \sum_i \alpha_i s_i \Rightarrow f(s) = \sum_i \alpha_i f(s_i) \quad \alpha_i \in \mathbb{R}$$

Proof: $s = \sum_i \alpha_i s_i$
 $s + \sum_{j \in I_-} |\alpha_j| s_j = \sum_{i \in I_+} |\alpha_i| s_i$

Consider a coarse-graining of all the outcomes of a fiducial mmt. $1 = \sum_i \alpha_i$
 $1 + \sum_{j \in I_-} |\alpha_j| = \sum_{i \in I_+} |\alpha_i| \equiv \mathcal{N}$

Thus: $\frac{1}{\mathcal{N}} s + \sum_{j \in I_-} \frac{|\alpha_j|}{\mathcal{N}} s_j = \sum_{i \in I_+} \frac{|\alpha_i|}{\mathcal{N}} s_i$

Convex linearity implies linearity

If f is convex linear on opt'l states

$$s = \sum_i w_i s_i \Rightarrow f(s) = \sum_i w_i f(s_i) \quad 0 \leq w_i \leq 1 \text{ and } \sum_i w_i = 1$$

Then f is linear on opt'l states

$$s = \sum_i \alpha_i s_i \Rightarrow f(s) = \sum_i \alpha_i f(s_i) \quad \alpha_i \in \mathbb{R}$$

Proof:

$$s = \sum_i \alpha_i s_i$$
$$s + \sum_{j \in I_-} |\alpha_j| s_j = \sum_{i \in I_+} |\alpha_i| s_i$$

Consider a coarse-graining of all the outcomes of a fiducial mmt.

$$1 = \sum_i \alpha_i$$

$$1 + \sum_{j \in I_-} |\alpha_j| = \sum_{i \in I_+} |\alpha_i| \equiv \mathcal{N}$$

$$\text{Thus: } \frac{1}{\mathcal{N}} s + \sum_{j \in I_-} \frac{|\alpha_j|}{\mathcal{N}} s_j = \sum_{i \in I_+} \frac{|\alpha_i|}{\mathcal{N}} s_i$$

$$\frac{1}{\mathcal{N}} f(s) + \sum_{j \in I_-} \frac{|\alpha_j|}{\mathcal{N}} f(s_j) = \sum_{i \in I_+} \frac{|\alpha_i|}{\mathcal{N}} f(s_i)$$

Convex linearity implies linearity

If f is convex linear on opt'l states

$$s = \sum_i w_i s_i \Rightarrow f(s) = \sum_i w_i f(s_i) \quad 0 \leq w_i \leq 1 \text{ and } \sum_i w_i = 1$$

Then f is linear on opt'l states

$$s = \sum_i \alpha_i s_i \Rightarrow f(s) = \sum_i \alpha_i f(s_i) \quad \alpha_i \in \mathbb{R}$$

Proof:

$$\begin{aligned} s &= \sum_i \alpha_i s_i \\ s + \sum_{j \in I_-} |\alpha_j| s_j &= \sum_{i \in I_+} |\alpha_i| s_i \end{aligned}$$

Consider a coarse-graining of all the outcomes of a fiducial mmt.

$$1 = \sum_i \alpha_i$$

$$1 + \sum_{j \in I_-} |\alpha_j| = \sum_{i \in I_+} |\alpha_i| \equiv \mathcal{N}$$

$$\text{Thus: } \frac{1}{\mathcal{N}} s + \sum_{j \in I_-} \frac{|\alpha_j|}{\mathcal{N}} s_j = \sum_{i \in I_+} \frac{|\alpha_i|}{\mathcal{N}} s_i$$

$$\frac{1}{\mathcal{N}} f(s) + \sum_{j \in I_-} \frac{|\alpha_j|}{\mathcal{N}} f(s_j) = \sum_{i \in I_+} \frac{|\alpha_i|}{\mathcal{N}} f(s_i)$$

$$f(s) = \sum_i \alpha_i f(s_i)$$

Convex linearity implies linearity

If f is convex linear on opt'l states

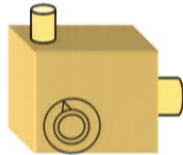

$$s = \sum_i w_i s_i \Rightarrow f(s) = \sum_i w_i f(s_i) \quad 0 \leq w_i \leq 1 \text{ and } \sum_i w_i = 1$$

Then f is linear on opt'l states

$$s = \sum_i \alpha_i s_i \Rightarrow f(s) = \sum_i \alpha_i f(s_i) \quad \alpha_i \in \mathbb{R}$$

Therefore $\exists \mathbf{r} : f(\mathbf{s}) = \mathbf{r} \cdot \mathbf{s}$

A convex operational theory

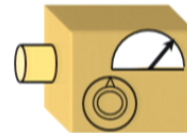

Preparation
 P

$$s_P \in S$$

“operational states”

S = Convex set

Measurement
 M

$$r_{M,k} \in R$$

“operational effects”

R = Interval of
positive cone

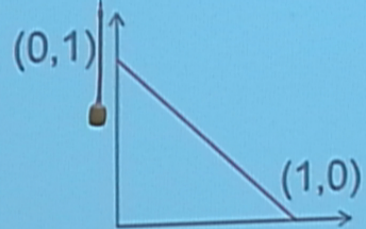

$$Pr(k|P, M) = r_{M,k} \cdot s_P$$

Operational classical theory

S can be any probability distribution

S = a simplex

$$s = (p(1), p(2))$$

Operational classical theory

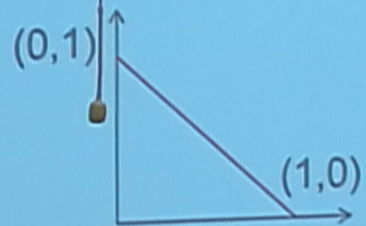

S can be any probability distribution

S = a simplex

\mathbf{r} can be any vector of conditional probabilities

R = the unit hypercube

$$s = (p(1), p(2))$$

Operational classical theory

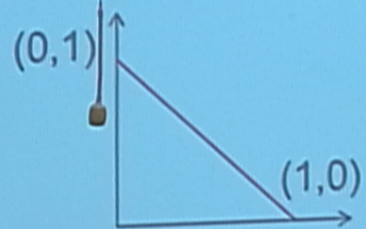

S can be any probability distribution

S = a simplex

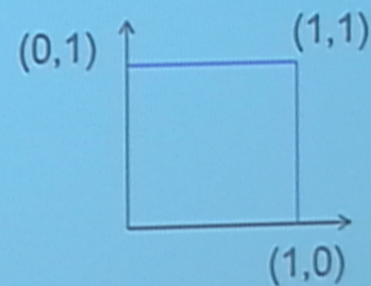

r can be any vector of conditional probabilities

R = the unit hypercube

$$s = (p(1), p(2))$$

$$r = (p(\text{pass}|1), p(\text{pass}|2))$$

Operational classical theory

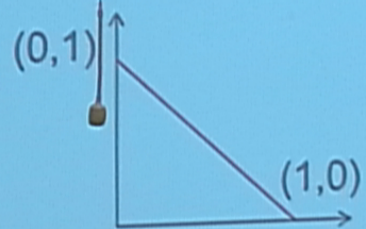

S can be any probability distribution

S = a simplex

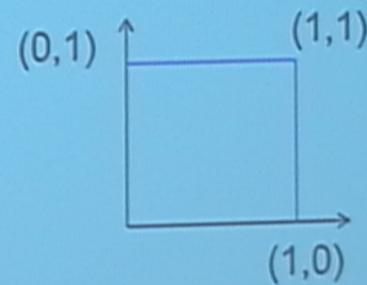

r can be any vector of conditional probabilities

R = the unit hypercube

$$s = (p(1), p(2))$$

$$r = (p(\text{pass}|1), p(\text{pass}|2))$$

Operational classical theory

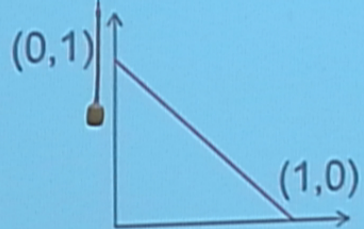

S can be any probability distribution

S = a simplex

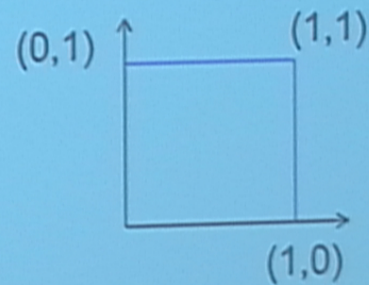

r can be any vector of conditional probabilities

R = the unit hypercube

$$s = (p(1), p(2))$$

$$r = (p(\text{pass}|1), p(\text{pass}|2))$$

$$Pr(\text{pass}) = r \cdot s = \sum_i p(i)p(\text{pass}|i)$$

Operational classical theory

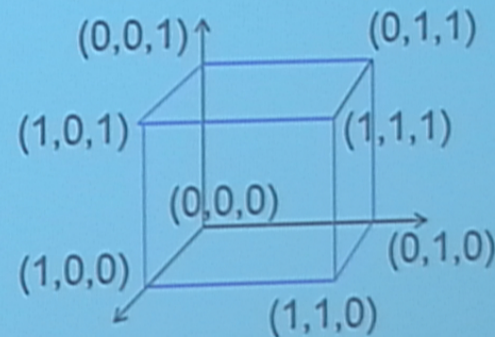

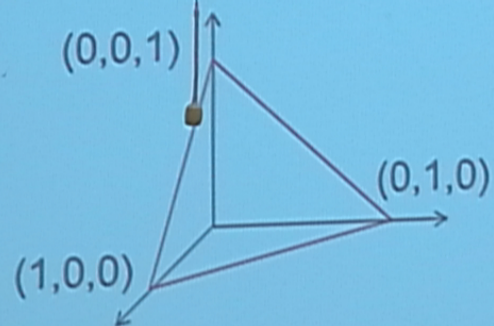

S can be any probability distribution

S = a simplex

r can be any vector of conditional probabilities

R = the unit hypercube

$$s = (p(1), p(2), p(3)) \quad r = (p(\text{pass}|1), p(\text{pass}|2), p(\text{pass}|3))$$

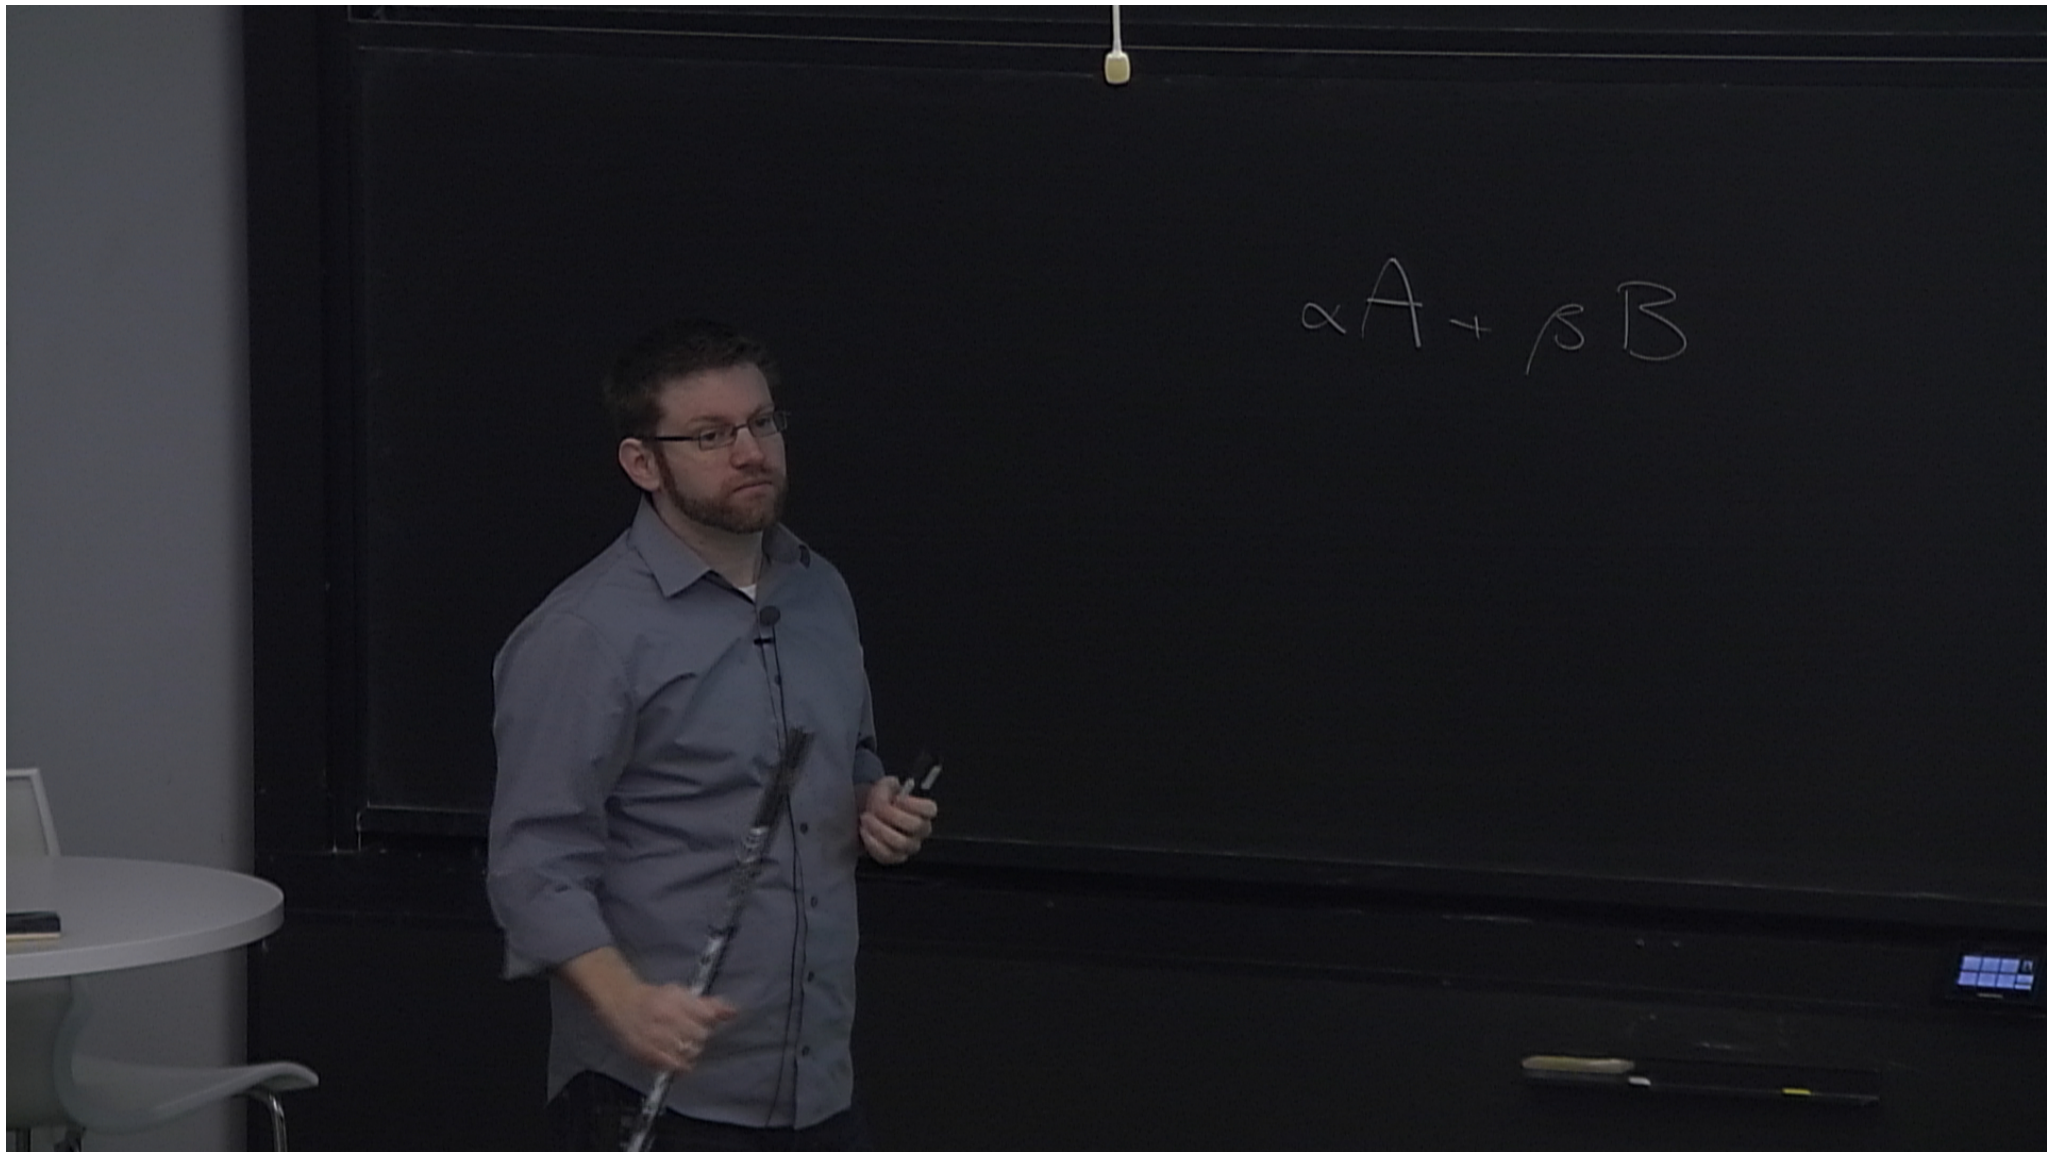

Operational quantum theory

Recall: The Hermitian operators on a Hilbert space of dimension d form a real Euclidean vector space of dimension d^2

S can be any unit-trace positive operator ρ positive, $\text{Tr}(\rho) = 1$

S = the convex set of such operators

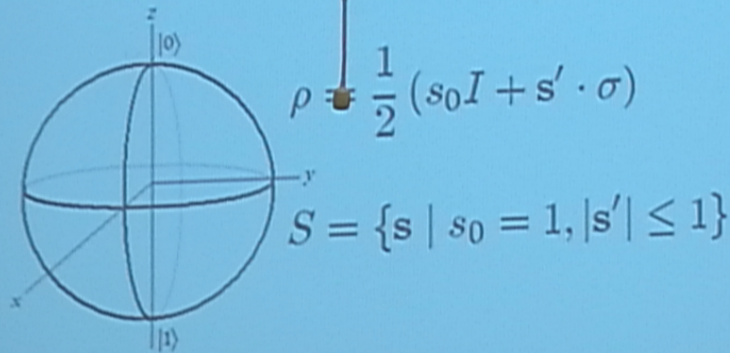

Operational quantum theory

Recall: The Hermitian operators on a Hilbert space of dimension d form a real Euclidean vector space of dimension d^2

S can be any unit-trace positive operator ρ positive, $\text{Tr}(\rho) = 1$
 $S =$ the convex set of such operators

Ex: A qubit. The space of Hermitian operators is spanned by $\{I, \sigma_z, \sigma_x, \sigma_y\}$

Operational quantum theory

Recall: The Hermitian operators on a Hilbert space of dimension d form a real Euclidean vector space of dimension d^2

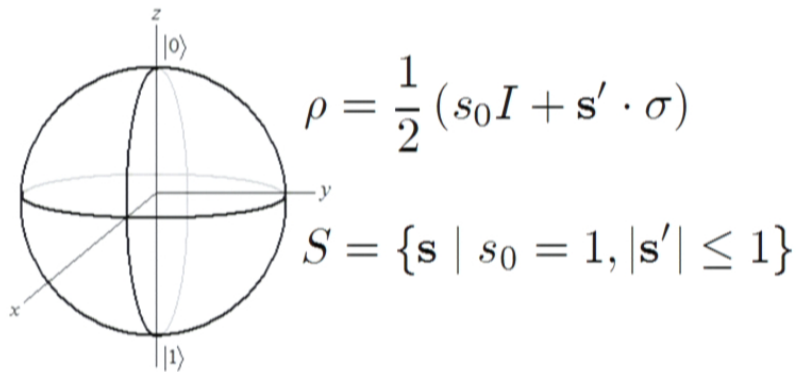

\mathbf{s} can be any unit-trace positive operator ρ positive, $\text{Tr}(\rho) = 1$

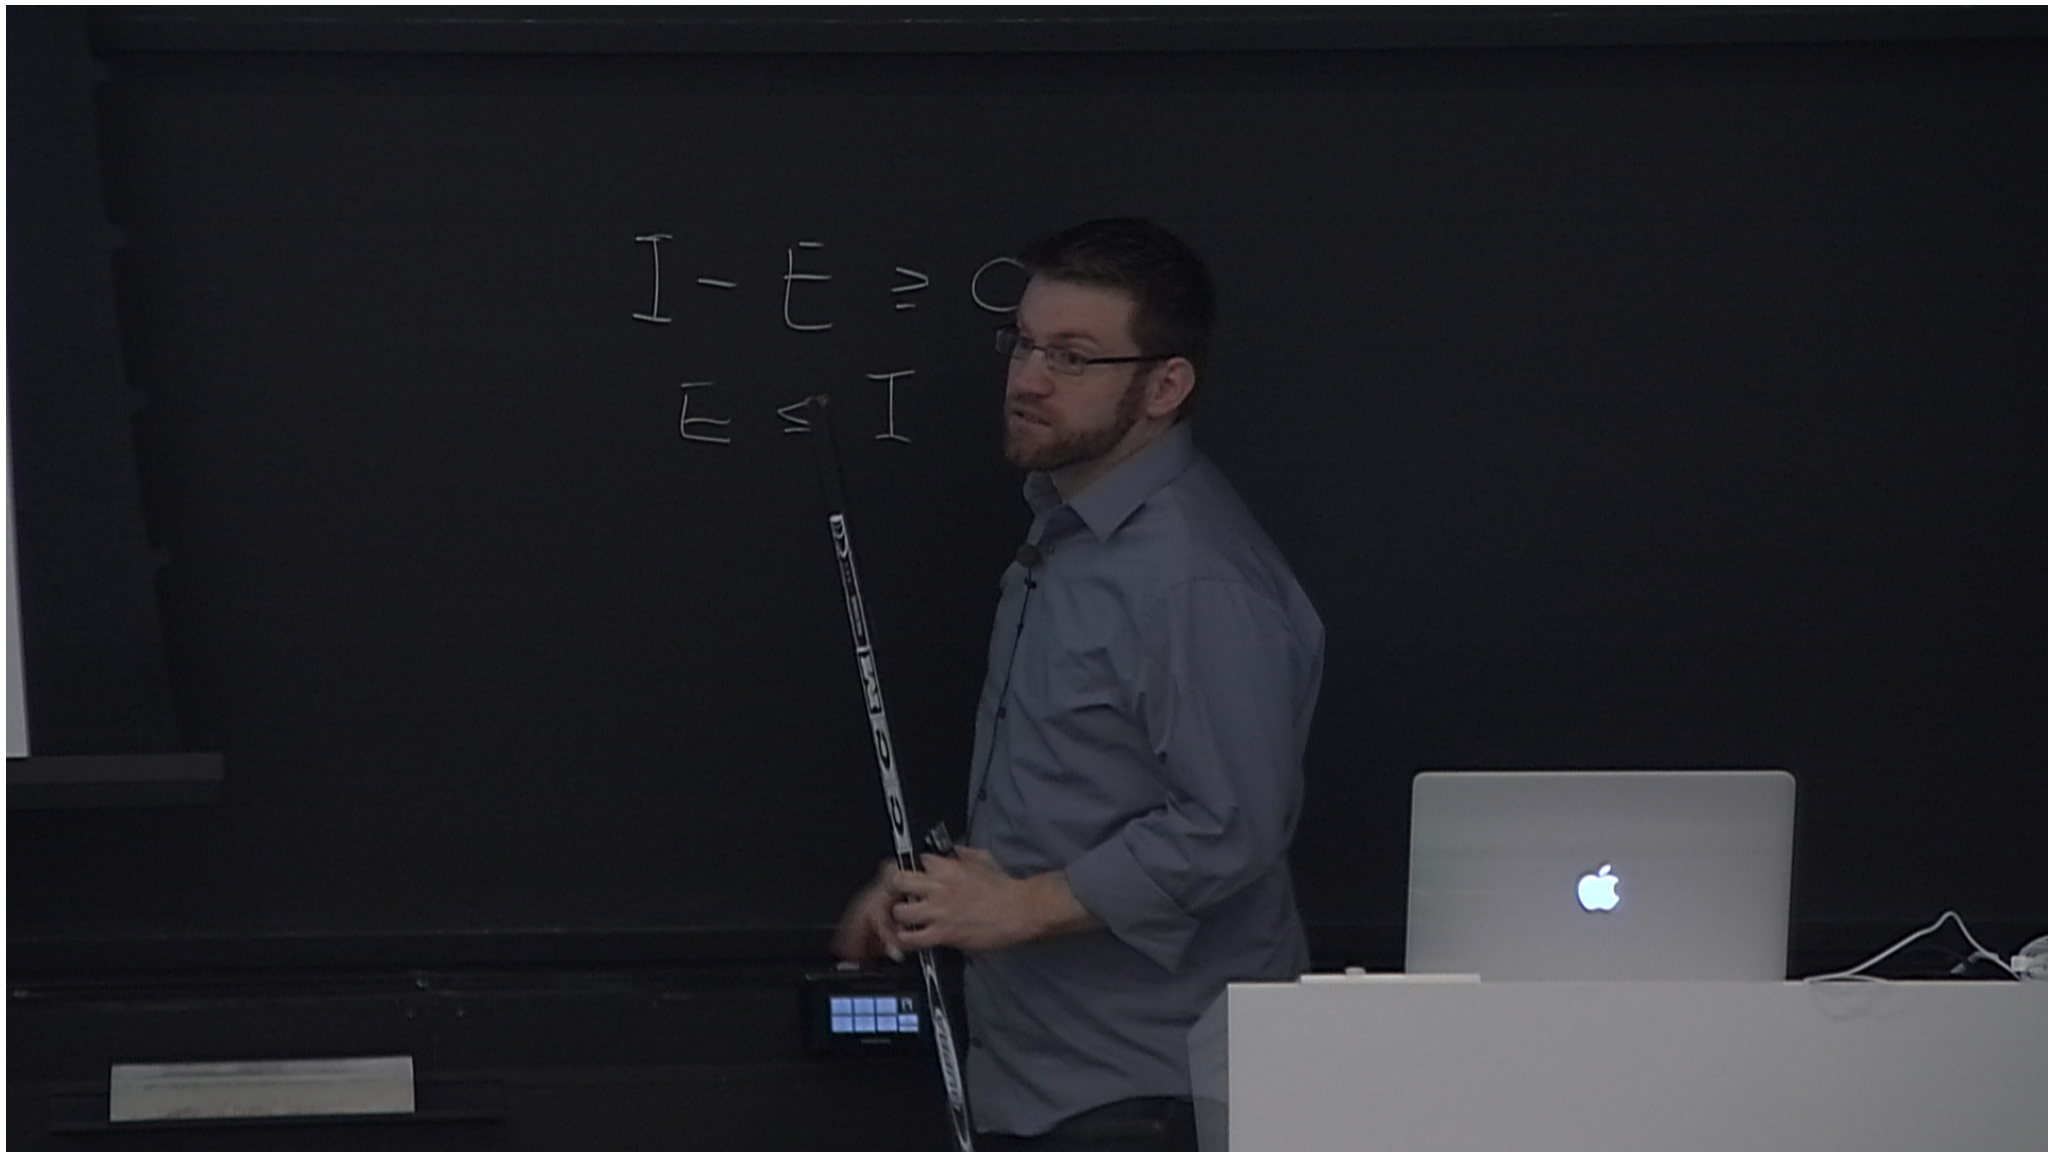

S = the convex set of such operators

\mathbf{r} can be any positive operator less than identity E , $I - E$ positive

R = an interval of the positive cone of such operators

Ex: A qubit. The space of Hermitian operators is spanned by $\{I, \sigma_z, \sigma_x, \sigma_y\}$

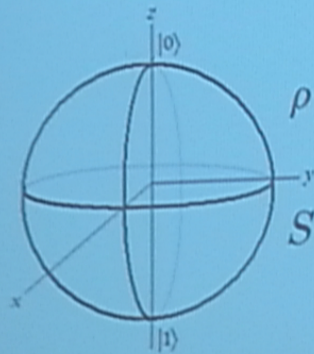

Operational quantum theory

Recall: The Hermitian operators on a Hilbert space of dimension d form a real Euclidean vector space of dimension d^2

S can be any unit-trace positive operator ρ positive, $\text{Tr}(\rho) = 1$
 $S =$ the convex set of such operators

Ex: A qubit. The space of Hermitian operators is spanned by $\{I, \sigma_z, \sigma_x, \sigma_y\}$

$$\rho = \frac{1}{2} (s_0 I + \mathbf{s}' \cdot \boldsymbol{\sigma})$$

$$S = \{ \mathbf{s} \mid s_0 = 1, |\mathbf{s}'| \leq 1 \}$$

Operational quantum theory

Recall: The Hermitian operators on a Hilbert space of dimension d form a real Euclidean vector space of dimension d^2

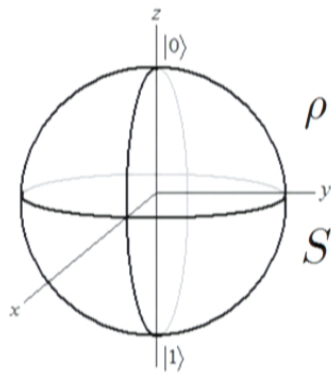

\mathbf{s} can be any unit-trace positive operator ρ positive, $\text{Tr}(\rho) = 1$

S = the convex set of such operators

\mathbf{r} can be any positive operator less than identity E , $I - E$ positive

$$E = r_0 I + \mathbf{r}' \cdot \boldsymbol{\sigma}$$

$$R = \{\mathbf{r} \mid 0 \leq r_0 \leq 1, |\mathbf{r}'| \leq r_0, 1 - r_0\}$$

$$Pr(\text{pass}) = \mathbf{r} \cdot \mathbf{s} = \text{Tr}(\rho E)$$

A little bit of axiomatics

Suppose one takes as given that

S = the convex set of positive trace-one operators

A little bit of axiomatics

Suppose one takes as given that

S = the convex set of positive trace-one operators

Suppose one assumes that every logically possible measurement is physically possible

Allow all $\{\mathbf{r}_k\}$ such that $\mathbf{r}_k \cdot \mathbf{s} \geq 0 \quad \forall \mathbf{s} \in S$

$$\sum_k \mathbf{r}_k \cdot \mathbf{s} = 1 \quad \forall \mathbf{s} \in S$$

A little bit of axiomatics

Suppose one takes as given that

S = the convex set of positive trace-one operators

Suppose one assumes that every logically possible measurement is physically possible

Allow all $\{\mathbf{r}_k\}$ such that $\mathbf{r}_k \cdot \mathbf{s} \geq 0 \quad \forall \mathbf{s} \in S$

$$\sum_k \mathbf{r}_k \cdot \mathbf{s} = 1 \quad \forall \mathbf{s} \in S$$

The real vector space is the space of Hermitian operators

The inner product is $(A, B) = \text{Tr}(AB)$

A little bit of axiomatics

Suppose one takes as given that

S = the convex set of positive trace-one operators

Suppose one assumes that every logically possible measurement is physically possible

Allow all $\{\mathbf{r}_k\}$ such that $\mathbf{r}_k \cdot \mathbf{s} \geq 0 \quad \forall \mathbf{s} \in S$

$$\sum_k \mathbf{r}_k \cdot \mathbf{s} = 1 \quad \forall \mathbf{s} \in S$$

The real vector space is the space of Hermitian operators

The inner product is $(A, B) = \text{Tr}(AB)$

Each \mathbf{s} is a density operator ρ

Each set $\{\mathbf{r}_k\}$ is a set of Hermitian operators $\{E_k\}$

A little bit of axiomatics

Suppose one takes as given that

S = the convex set of positive trace-one operators

Suppose one assumes that every logically possible measurement is physically possible

Allow all $\{\mathbf{r}_k\}$ such that $\mathbf{r}_k \cdot \mathbf{s} \geq 0 \quad \forall \mathbf{s} \in S$

$$\sum_k \mathbf{r}_k \cdot \mathbf{s} = 1 \quad \forall \mathbf{s} \in S$$

The real vector space is the space of Hermitian operators

The inner product is $(A, B) = \text{Tr}(AB)$

Each \mathbf{s} is a density operator ρ

Each set $\{\mathbf{r}_k\}$ is a set of Hermitian operators $\{E_k\}$

$$\mathbf{r}_k \cdot \mathbf{s} = (E_k, \rho) = \text{Tr}(E_k \rho) \quad \leftarrow \text{the form of the Born rule}$$

$$\text{Tr}(\rho E_k) \geq 0 \quad \forall \rho \in \mathcal{S}(\mathcal{H})$$

$$\rightarrow \langle \psi | E_k | \psi \rangle \geq 0 \quad \forall |\psi\rangle \in \mathcal{H}$$

$\rightarrow E_k$ is a positive operator

$$\sum_k \text{Tr}(\rho E_k) = 1 \quad \forall \rho \in \mathcal{S}(\mathcal{H})$$

$$\rightarrow \langle \psi | (\sum_k E_k) | \psi \rangle = 1 \quad \forall |\psi\rangle \in \mathcal{H}$$

$$\rightarrow \sum_k E_k = I$$

The logically possible measurements are the set of the POVMs

We have derived:

- R = the set of all positive operators less than identity
- the Born rule

Operational formulation of quantum theory

Every preparation P is associated with a density operator ρ

Every logically possible measurement is physically possible

↳ Every measurement M is associated with a positive operator-valued measure $\{E_k\}$. The probability of M yielding outcome k given a preparation P is $Pr(k|P, M) = \text{Tr}(\rho E_k)$

Every transformation is associated with a trace-preserving completely-positive linear map $\rho \rightarrow \rho' = \mathcal{T}(\rho)$

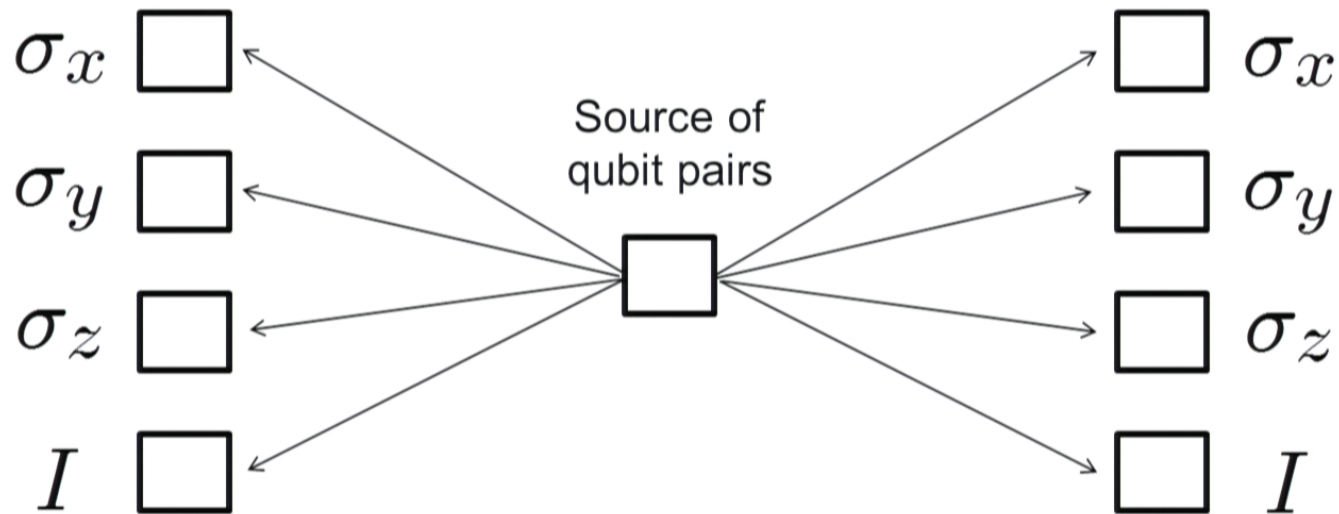

Every measurement outcome k is associated with a trace-nonincreasing completely-positive linear map \mathcal{T}_k such that

$$\rho \rightarrow \rho_k = \frac{\mathcal{T}_k(\rho)}{\text{Tr}[\mathcal{T}_k(\rho)]} \quad \text{where} \quad \mathcal{T}_k^\dagger(I) = E_k$$

Real versus complex field

	real case	complex case
Pure preparations	rays in \mathbb{R}^d	rays in \mathbb{C}^d
Complete repeatable measurements	Bases for \mathbb{R}^d	Bases for \mathbb{C}^d
Reversible transformations	Special orthogonal (rotation)	Unitary
Mixed preparations	Positive unit-trace real matrix	Positive unit-trace complex matrix
Composition rule	Tensor product	Tensor product

State tomography for two qubits

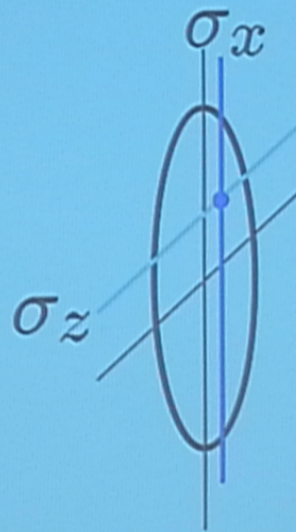

We need $4^2 - 1 = 15$ parameters

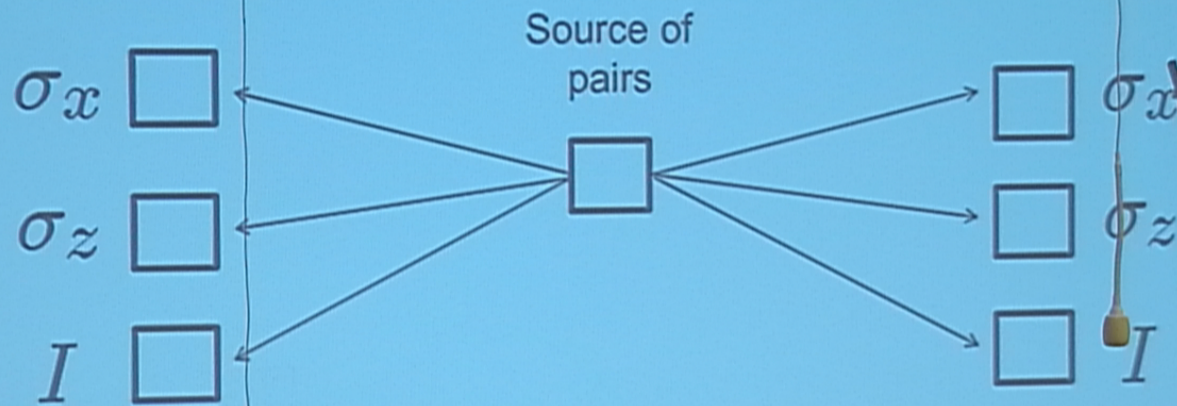

We obtain $4^2 - 1 = 15$ parameters

The mixed state of two qubits can be determined from local measurements

State tomography for a single real-amplitude qubit

State tomography for two real-amplitude qubits

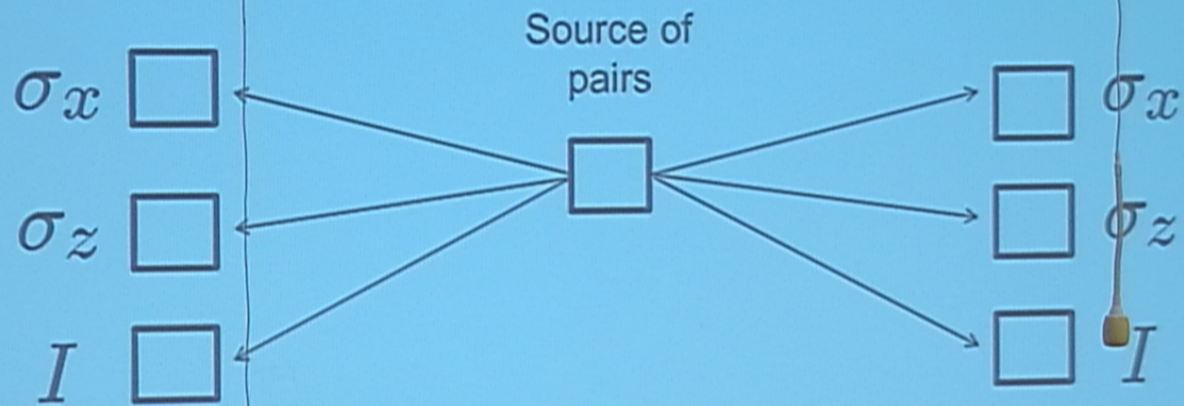

We need $4(4+1)/2 - 1 = 9$ parameters

We obtain $3^2 - 1 = 8$ parameters

$\sigma_y \otimes \sigma_y$ must be accessed globally

The mixed state of two real-amplitude qubits
cannot be determined from local measurements -- a kind of holism

State tomography for two real-amplitude qubits

We need $4(4+1)/2 - 1 = 9$ parameters

We obtain $3^2 - 1 = 8$ parameters

$\sigma_y \otimes \sigma_y$ must be accessed globally

The mixed state of two real-amplitude qubits
cannot be determined from local measurements -- a kind of holism
