Title: Psi-epistemic models are exponentially bad at explaining the distinguishability of quantum states
Date: Feb 18, 2014 03:30 PM
URL: http://pirsa.org/14020145
Abstract: <span> The status of the quantum state is perhaps the most controversial issue in the foundations of quantum theory. Is it an epistemic state (representing knowledge, information, or belief) or an ontic state (a direct reflection of reality)? In the ontological models framework, quantum states correspond to probability measures over more fundamental states of reality. The quantum state is then ontic if every pair of pure states corresponds to a pair of measures that do not overlap, and is otherwise epistemic. Recently, several authors have derived theorems that aim to show that the quantum state must be ontic in this framework. Each of these theorems involve auxiliary assumptions of varying degrees of plausibility. Without such assumptions, it has been shown that models exist in which the quantum state is epistemic. However, the definition of an epistemic quantum state used in these works is extremely permissive. Only two quantum states need correspond to overlapping measures and furthermore the amount of overlap may be arbitrarily small. In order to provide an explanation of quantum phenomena such as no-cloning and the indistinguishability of pure states, the amount of overlap should be comparable to the inner product of the quantum states. In this talk, I show, without making auxiliary assumptions, that the ratio of overlap to inner product must go to zero exponentially in Hilbert space dimension for some families of states. This is done by connecting the overlap to Kochen-Specker noncontextuality, from which we infer that any contextuality inequality gives a bound on the ratio of overlap to inner product.</span>

# $\psi$-epistemic models are exponentially bad at explaining the distinguishability of quantum states

An ontological model for $\mathbb{C}^{d}$ consists of:

- A measurable space $(\Lambda, \Sigma)$.
- For each state $|\psi\rangle \in \mathbb{C}^{d}$, a probability measure $\mu_{\psi}: \Sigma \rightarrow[0,1]$.
- For each orthonormal basis $M=\{|a\rangle,|b\rangle, \ldots\}$, a set of response functions $\xi_{a}^{M}: \Lambda \rightarrow[0,1]$ satisfying

$$
\forall \lambda, \quad \sum_{|a\rangle \in M} \xi_{a}^{M}(\lambda)=1 .
$$

The model is required to reproduce the quantum predictions, i.e.

$$
\int_{\Lambda} \xi_{a}^{M}(\lambda) d \mu_{\psi}=|\langle a \mid \psi\rangle|^{2}
$$

- $|\psi\rangle$ and $|\phi\rangle$ are ontologically distinct in an ontological model if there exists $\Omega \in \Sigma$ s.t.

$$
\mu_{\psi}(\Omega)=1
$$

$$
\mu_{\phi}(\Omega)=0 .
$$

- An ontological model is $\psi$-ontic if every pair of states is ontologically distinct. Otherwise it is $\psi$-epsitemic.

Ontological Models
$\psi$-ontology theorems
$\psi$-epistemic models
Overlap measures Asymmetric overlap
Classical Symmetric overlap
Quantum Symmetric
overlap
Relationships between
overlap measures
Overlap bounds
Conclusions

- Classical symmetric overlap:

$$
S_{c}(\psi, \phi):=\inf _{\Omega \in \Sigma}\left[\mu_{\psi}(\Omega)+\mu_{\phi}(\Lambda \backslash \Omega)\right]
$$

- Optimal success probability of distinguishing $|\psi\rangle$ and $|\phi\rangle$ if you know $\lambda$ :

$$
p_{c}(\psi, \phi)=\frac{1}{2}\left(2-S_{c}(\psi, \phi)\right)
$$

## Relationships between overlap measures

Introduction
Arguments for Epistemic Quantum States
Arguments for Ontic Quantum States

Ontological Models
$y$-ontology theorems
$\psi$-epistemic models
Overlap measures Asymmetric overlap Classical Symmetric overlap
Quantum Symmetric
overlap
Relationships between overlap measures

Overlap bounds
Conclusions

- Classical overlap measures:

$$
S_{c}(\psi, \phi) \leq A_{c}(\psi, \phi)
$$

- Quantum overlap measures:

$$
\begin{aligned}
& -S_{q}(\psi, \phi)=1-\sqrt{1-|\langle\phi \mid \psi\rangle|^{2}} \\
& -S_{q}(\psi, \phi) \geq \frac{1}{2}|\langle\phi \mid \psi\rangle|^{2}
\end{aligned}
$$

- Hence:

$$
\frac{S_{c}(\psi, \phi)}{S_{q}(\psi, \phi)} \leq 2 \frac{A_{c}(\psi, \phi)}{|\langle\phi \mid \psi\rangle|^{2}} .
$$

Then, in any ontological model

$$
\bar{k}(\psi) \leq \frac{\alpha(G)}{|V| \min _{|a\rangle \in V}|\langle a \mid \psi\rangle|^{2}} .
$$

Conclusions

- Let $\mathcal{M}$ be a covering set of bases for $V$.
- For $M \in \mathcal{M}$, let

$$
\Gamma_{a}^{M}=\left\{\lambda \mid \xi_{a}^{M}(\lambda)=1\right\}
$$

$-\mu_{a}\left(\Gamma_{a}^{M}\right)=1$ because $\int_{\Lambda} \xi_{a}^{M}(\lambda) d \mu_{a}=|\langle a \mid a\rangle|^{2}=1$.

- Let

$$
\begin{aligned}
& \qquad \Gamma_{a}^{\mathcal{M}}=\cap_{\{M \in \mathcal{M} \| a\rangle \in M\}} \Gamma_{a}^{M} \\
& -\mu_{a}\left(\Gamma_{a}^{\mathcal{M}}\right)=1 \text { also. }
\end{aligned}
$$

Conclusions
Summary and Open
questions
What now for
$\psi$-epistemicists?
References

- Summary
- There exist pairs of states such that $k(\psi, \phi) \leq d e^{-c d}$. The $\psi$-epsitemic explanations of indistinguishability, no-cloning, etc. get implausible for these states very radpidly for large $d$.
- Any contextuality inequality can be used to derive an overlap bound.
- Open questions
- Error analysis.
- Best bounds in small dimensions.
- Bounds with a fixed inner product.
- Connection to communication complexity.

Proof of main result:2 Proof of main result:3
Contextuality
Conclusions

- For $\boldsymbol{x}=\left(x_{0}, x_{1}, \ldots, x_{d-1}\right) \in\{0,1\}^{d}$, let

$$
\left|a_{\boldsymbol{x}}\right\rangle=\frac{1}{\sqrt{d}} \sum_{j=0}^{d-1}(-1)^{x_{j}}|j\rangle .
$$

- Let $|\psi\rangle=|0\rangle$.
- By Frankl-Rödl theorem ${ }^{1}$, for $d$ divisible by 4 , there exists an $\epsilon>0$ such that $\alpha(G) \leq(2-\epsilon)^{d}$.

$$
\begin{gathered}
\bar{k}(\psi) \leq \frac{\alpha(G)}{2^{d} \min _{x \in\{0,1\}^{d}}\left|\left\langle a_{\boldsymbol{x}} \mid \psi\right\rangle\right|^{2}}=\frac{(2-\epsilon)^{d}}{2^{d} \times \frac{1}{d}}=d e^{-c d} \\
c=\ln 2-\ln (2-\epsilon)
\end{gathered}
$$

Summary and Open
questions
What now for
$\psi$-epistemicists?
Reterences

- Become neo-Copenhagen.
- Adopt a more exotic ontology:
- Nonstandard logics and probability theories.
- Ironic many-worlds.
- Retrocausality.
- Relationalism.
- Principle of minimal weirdness: QM is weird but an interpretation of QM should not be more weird than it has to be.
- Suggests exploring exotic ontologies.

Conclusions

$$
k(\psi, \phi)=\frac{A_{c}(\psi, \phi)}{|\langle\phi \mid \psi\rangle|^{2}} .
$$

- Maroney showed $k(\psi, \phi)<1$ for some states. ML and Maroney showed this follows from KS theorem.
- Barrett et. al. exhibited a family of states in $\mathbb{C}^{d}$ such that:
- Today: $k(\psi, \phi) \leq d e^{-c d}$ for $d$ divisible by 4 .
