

Title: M-strings and their orbifolds

Date: May 20, 2014 02:00 PM

URL: <http://pirsa.org/14050005>

Abstract: We consider M-theory in the presence of  $M$  parallel M5-branes probing a transverse  $A_{N-1}$  singularity. This leads to a superconformal theory with  $(1,0)$  supersymmetry in six dimensions. We compute the supersymmetric partition function of this theory on a two-torus, with arbitrary supersymmetry preserving twists, using the topological vertex formalism. Alternatively, we show that this can also be obtained by computing the elliptic genus of an orbifold of recently studied M-strings. The resulting 2d theory is a  $(4,0)$  supersymmetric quiver gauge theory whose Higgs branch corresponds to strings propagating on the moduli space of  $SU(N)^{(M-1)}$  instantons on  $R^4$  where the right-moving fermions are coupled to a particular bundle.
