# The Questions ?

- Can we define the entropy of gravitational systems ?

Time evolution of **non** gravitational system

•Can we define the entropy of gravitational systems ?  
Can we understand entropy production as gravity wave production?

PERIMETER  INSTITUTE FOR THEORETICAL PHYSICS

Ball modes

$$T(q) = \sum_{n=1}^N -\ln(q_n)$$
$$\Delta T \leftarrow \left( \frac{\sum_i \ln(q_i)}{N} \right)$$
$$\ln \left( \frac{q_1}{q_2} \cdots q_N} \right)$$

$$R_{\text{eg}} = \frac{k}{m} \frac{1}{\omega_s}$$
$$= N^2 \lambda S$$

Question: Gravity Thermodynamics  
•Can we define the entropy of gravitational systems ?  
•Can we understand entropy production as gravity wave production?

$$\frac{N_n}{\sum_n W_n} = \phi_n$$

$$J = \underbrace{\log N}_{S_{\max}} - S[\phi_n]$$

$$\leq \left\langle \sum_{\text{traces}} b(\text{trace}) \right\rangle$$

bias.:

$$b_{n,n_{k,i}} = \ln \left( \frac{J_{n,n_{k,i}}}{J_{n,n_{k,i}}^{\text{max}}} \right)$$

$$R_{\text{eg}} = \frac{\hbar}{m}$$

$$= N^2$$

### Question Gravity Thermodynamics

- Can we define the entropy of gravitational systems?
- Can we understand entropy production as gravity wave production?

$$\frac{N_n}{\sum_n W_n} = \phi_n$$

$$J = \underbrace{\log N}_{S_{\max}} - S[\phi_n]$$

$$\leq \left\langle \sum_{\text{modes}} b(\text{mode}) \right\rangle$$

bias.:  $b_{n_1 n_2 \dots} = \ln \left( \frac{J_{n_1 n_2 \dots}}{J_{\text{max}} \phi_n} \right)$

$$R_{\text{eg}} = \frac{\hbar}{m} \frac{1}{W_I}$$

$$= N \lambda \frac{S}{V}$$

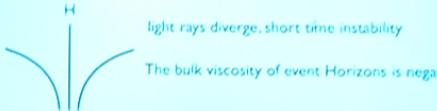

### Question Gravity Thermodynamics

- Can we define the entropy of gravitational systems ?

Can we understand entropy production as gravity wave production?

- Is there a local and physical definition of Horizons ?

Event Horizons are teleological and thermodynamically unstable

The bulk viscosity of event Horizons is negative

$$\frac{N_n}{\sum_n N_n} = \phi_n$$

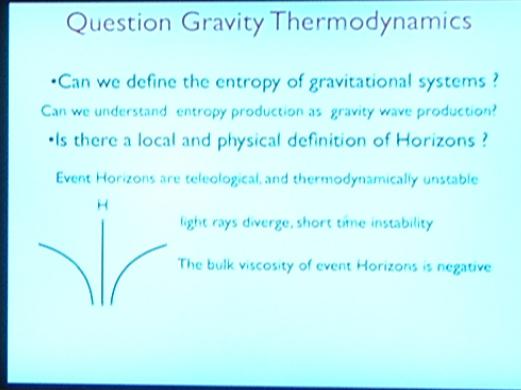

$$\underbrace{\log N}_{S_{max}} - S[\phi_n]$$

$$\left\langle \sum_{\text{traces}} b(\text{trace}) \right\rangle$$

traces:  $b_{n_{\mu_1 \mu_2 \dots}} = \ln \left( \frac{J_{n_{\mu_1 \mu_2 \dots}}}{J_{n_{\mu_1 \hat{\mu}_2 \dots}}} \right)$

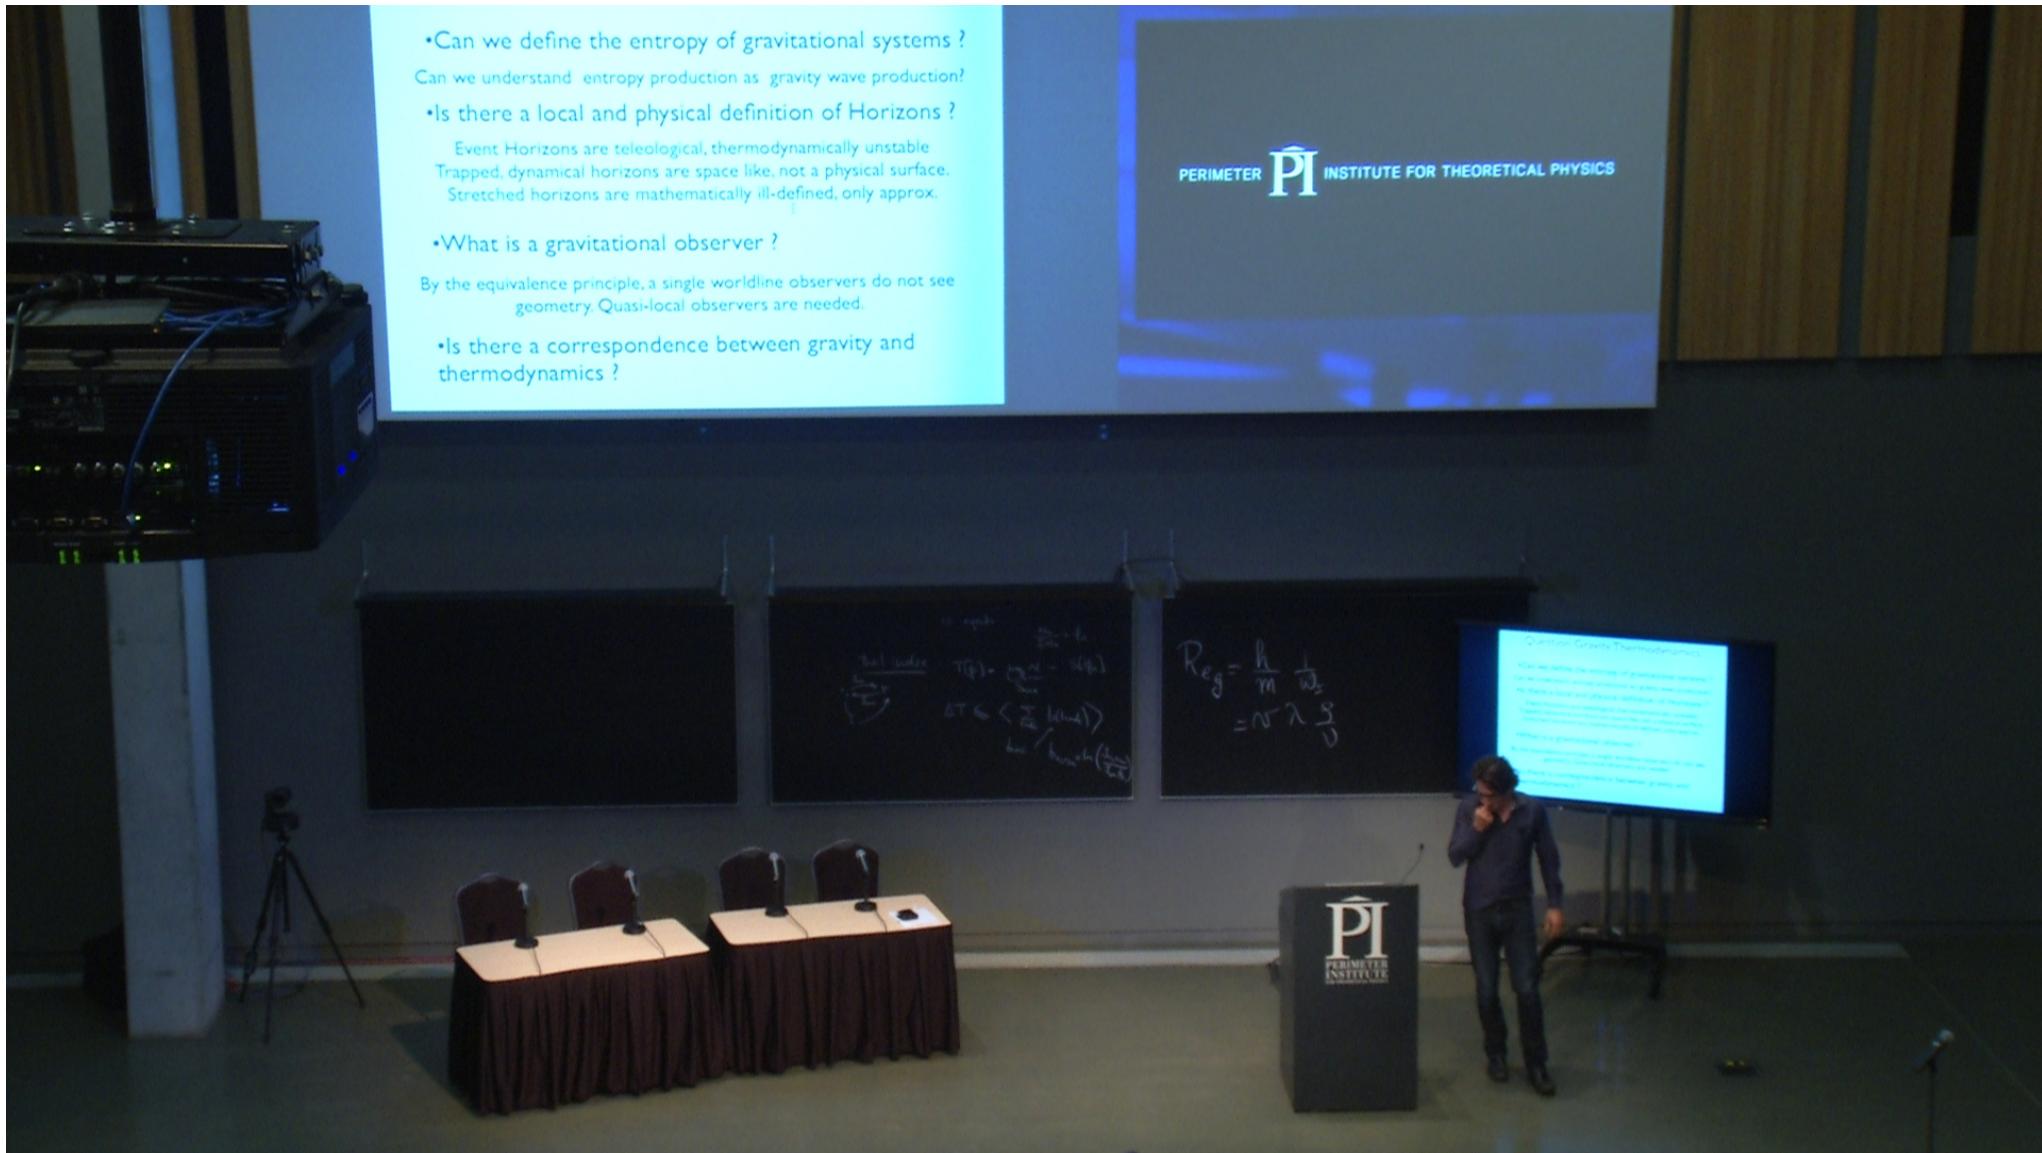

$$R_{eg} = \frac{\hbar}{m} \frac{1}{T} = \sqrt{\lambda} \frac{S}{V}$$

FOR THEORETICAL PHYSICS

- Can we define the entropy of gravitational systems ?  
Can we understand entropy production as gravity wave production?
- Is there a local and physical definition of Horizons ?  
Event Horizons are teleological, thermodynamically unstable.  
Trapped, dynamical horizons are space like, not a physical surface.  
Stretched horizons are mathematically ill-defined, only approx.
- What is a gravitational observer ?  
By the equivalence principle, a single worldline observers do not see geometry. Quasi-local observers are needed.
- Is there a correspondence between gravity and thermodynamics ?

# Question Gravity Thermodynamics

- Can we define the entropy of gravitational systems ?

Can we understand entropy production as gravity wave production?

- Is there a local and physical definition of Horizons ?

Event Horizons are **teleological**, thermodynamically unstable  
Trapped, dynamical horizons are space like, not a physical surface.  
Stretched horizons are mathematically ill-defined, only approx.

I

- What is a gravitational observer ?

By the equivalence principle, a single worldline observers do not see geometry. Quasi-local observers are needed.

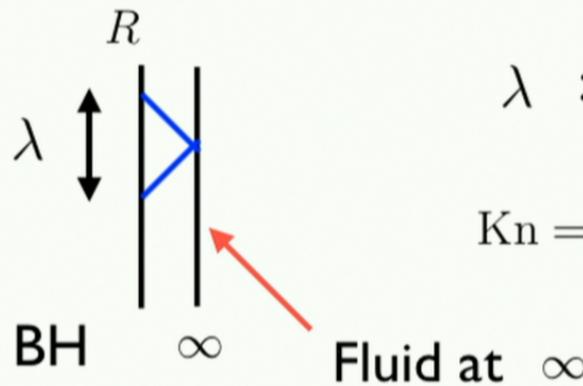

- Is there a correspondence between gravity and thermodynamics ?

## Analogy Gravity-Thermodynamics

- There seems to be lots of evidence of a correspondence between Black Hole physics and eq. thermo-**Static**.
- Is it just an analogy or is there a deeper correspondence? which is valid locally and **beyond equilibrium**.

bias:  $b_{n_1 n_2 n_3} = \ln \left( \frac{\int_{n_1 n_2 n_3}}{\int_{n_1 n_2 n_3}} \right)$

Reg

$$\frac{h}{m} \frac{1}{v} = N$$

N agents

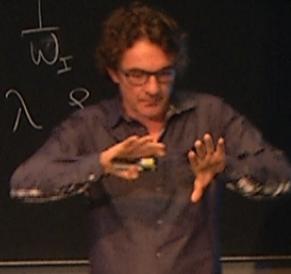

$$\frac{N_n}{\sum N_n} = \phi_n$$

ent index

$$T[\phi] = \underbrace{\log N}_{S_{\max}} - S[\phi_n]$$
$$\Delta T \leq \left\langle \sum_{\text{leads}} b(\text{leads}) \right\rangle$$

bias:  $b_{n_1 n_2 \dots} = \ln \left( \frac{J_{n_1 n_2 \dots}}{J_{\text{leads}}} \right)$

$$R_{\text{eg}} = \frac{h}{m} \frac{1}{\omega_I}$$
$$= N \lambda^2$$

### The second Law

In order to find the entropy current we need to organize expansion around equilibrium

Two expansion parameter:

$$\text{Knudsen number: } Kn = \frac{\lambda}{L}$$

$$\text{Inverse Rayleigh number: } Ra^{-1} = \frac{|g|}{P_1}$$

These parameters are related for non-relativistic Newtonian fluids but 2 different expansions in general.  
Derivative expansion versus low viscosity expansion.

N agents

$$\frac{N_n}{\sum N_n} = \phi_n$$

ent index

$$T[\phi] = \log \frac{N}{S_{\max}} - S[\phi]$$
$$\Delta T \leq \left\langle \sum_{\text{leads}} b(\text{leads}) \right\rangle$$

bias:  $b_{n_1 n_2 n_3} = \ln \left( \frac{J_{n_1 n_2 n_3}}{J_{\text{min}}} \right)$

$$R_{eg} = \frac{\hbar}{m} \frac{1}{\omega_I}$$
$$= N \lambda \frac{g}{v}$$

The second Law II  
Causal relativistic fluid dynamics requires relaxing local equilibrium and keeping second order contributions

$$S^a = \left[ s - \frac{1}{2} (\beta_\pi \pi^2 + \beta_\Pi \Pi - \Pi) \right] u^a$$

position of positivity can still be  
using only the  $(\zeta, \eta)$  viscosities

$$D_a S^a = \beta \left( \frac{\pi^2}{2\zeta} + \frac{\Pi^b H_{ab}}{2\eta} \right) \geq 0$$

Algebra we obtain the constitutive equations

## The second Law II

Causal relativistic fluid dynamics requires relaxing local equilibrium and keeping second order contributions

$$S^a = \left[ s - \frac{1}{2} (\beta_\pi \pi^2 + \beta_\Pi \Pi : \Pi) \right] u^a$$

Grad- Israel-Stewart

Muller-Israel-Stewart

The imposition of positivity can still be done using only the  $(\zeta, \eta)$  viscosities

$$D_a S^a = \beta \left( \frac{\pi^2}{2\zeta} + \frac{\Pi^{ab} \Pi_{ab}}{2\eta} \right) \geq 0$$

After some algebra we obtain the constitutive equations

$$Re_g = \frac{h}{m} \frac{1}{\omega_i}$$

$$= \sqrt{\lambda} \frac{g}{V}$$

The second Law and Gravity

Remarkably there exist a choice of coefficients for which the constitutive equation for bulk pressure is equal to a component of Einstein equation

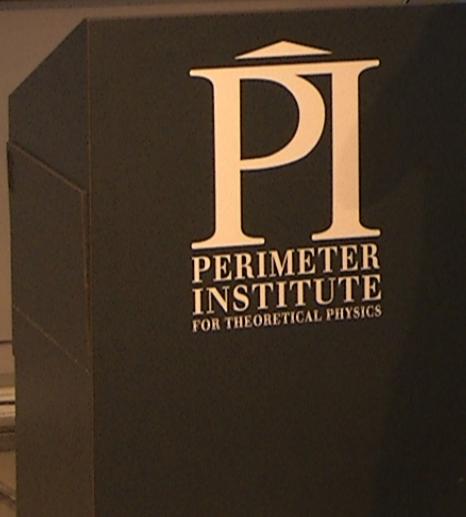

$$\tau_\pi(\dot{\pi} + \frac{1}{2}\theta\pi) + \lambda H : \sigma = \alpha_\pi\pi$$

$$\lambda = -\tau_\pi/2 \quad \alpha_\pi = 0$$

Constitutive equation for bulk pressure determines the rate of falling gravity waves

$$W_{SA}$$

Constitutive laws are not unique

$$Re_g = \frac{h}{m} \frac{\perp}{\omega_i}$$

$$= \sqrt{\lambda} \frac{S}{V}$$

### Conclusion

- Profound correspondence between gravity and non equilibrium thermo: Membrane paradigm redux.
- A gravitational screen carries a viscous relativistic fluid
- Key idea to describe a gravitational screen: use a low viscosity expansion for the hydrodynamic derivative expansion. Very different from a viscous fluid.
- Remarkably the truncated second law to second order is consistent with GR. It appears as a low viscosity expansion of a theory of Einstein GR = near eq.
- It suggest that the low viscosity expansions of gravity corresponds to the low viscosity expansion of stat mechanics.
- Is it useful?
