

Title: Extending the state space of LQG

Date: Dec 10, 2014 03:30 PM

URL: <http://pirsa.org/14120011>

Abstract:

Instead of formulating the state space of a quantum field theory over a single big Hilbert space, it has been proposed by Jerzy Kijowski to describe quantum states as projective families of density matrices over a collection of smaller, simpler Hilbert spaces. I will discuss the physical motivations for this approach and explain how it can be implemented in the context of LQG. While the resulting state space forms a natural extension of the Ashtekar-Lewandowski Hilbert space, it treats position and momentum variables on equal footing. This paves the way for the construction of semi-classical states beyond fixed graph level, and eventually for the derivation of LQC from full LQG.

Why?

- ▶ LQG treatment of holonomies / flux is very unbalanced
→ serious issue when looking for well-behaved coherent states
[see also: Koslowski & Sahlmann '11, Dittrich & Geiller '14]
- ▶ working with a stack of small theories is technically comfortable until we try to go beyond fixed graph
→ at the end we need to put the pieces together
[see also: Freidel & Ziprick '11 & '13]
- ▶ the LQG way (similar to standard QFT): discrete excitations around a vacuum $\rightsquigarrow \oplus$
- ▶ alternative: interpret small theories as specialization into specific observables of the continuous theory $\rightsquigarrow \otimes$
[see also: Thiemann & Winkler '01]

How?

- ▶ usual construction relies on writing the **configuration** space as a projective limit → let's write the **phase** space as a projective limit... [see also: Thiemann '01]
- ▶ transcription at the quantum level → projective families of density matrices, the projections are given by appropriate partial traces [Kijowski '76, Okołów '09 & '13]
- ▶ physical insight → a given experiment only measures a finite number of observables

Projective Systems of Phase Spaces

$$\eta \preceq \eta' \preceq \eta'' \in \mathcal{L}$$

Collection of partial theories:

- ▶ label set \mathcal{L} , \preceq
- ▶ $\eta \in \mathcal{L}$ = a selection of d.o.f.'s
- ▶ 'small' symplectic manifolds \mathcal{M}_{η}

Ensuring consistency:

- ▶ projections $\pi_{\eta' \rightarrow \eta}$ for $\eta \preceq \eta'$
- ▶ compatible with symplectic structures
- ▶ 3-spaces-consistency
→ projective system

[Projective state spaces: Kijowski '76, Okołów '09 & '13]

Projections & Factorizations

$\mathcal{M}_{\eta'}$

$\downarrow \pi$

\mathcal{M}_{η}

s.g.

$$\{f, g\}_{\eta} \circ \pi = \{f \circ \pi, g \circ \pi\}_{\eta'}$$

Toy Model: Schrödinger Equation

As a classical field theory

$$\mathcal{M}_{\mathcal{I}'} \approx \mathcal{M}_{\mathcal{I}} \times (\mathcal{I}^\perp \cap \mathcal{I}')$$

$$\mathcal{I} \subset \mathcal{I}' \subset \mathcal{H}$$

Phase space $\mathcal{H} \times \mathbb{R}^2$:

- ▶ Hilbert space \mathcal{H} with $\Omega_{\mathcal{H}} = 2 \operatorname{Im} \langle \cdot, \cdot \rangle$
- ▶ $\mathbb{R}^2 = \text{time \& energy}$

Projective description:

- ▶ labels: finite dimensional vector subspaces $\mathcal{I} \subset \mathcal{H}$
- ▶ $\mathcal{M}_{\mathcal{I}} = \mathcal{I} \times \mathbb{R}^2$
- ▶ $\pi_{\mathcal{I}' \rightarrow \mathcal{I}} = \Pi_{\mathcal{I}}|_{\mathcal{I}'} \times \operatorname{id}_{\mathbb{R}^2}$

Projective Systems of Quantum State Spaces

Modeled on special case:

- ▶ classical factorizations
 $\mathcal{M}_{\eta'} \approx \mathcal{M}_{\eta' \rightarrow \eta} \times \mathcal{M}_{\eta}$
- ▶ 3-spaces consistency
 $\mathcal{M}_{\eta'' \rightarrow \eta} \approx \mathcal{M}_{\eta'' \rightarrow \eta'} \times \mathcal{M}_{\eta' \rightarrow \eta}$
- ▶ quantum equivalent
 $\rightarrow \otimes$ -factorizations

Projective families $(\rho_{\eta})_{\eta \in \mathcal{L}}$:

- ▶ ρ_{η} density matrix on \mathcal{H}_{η}
- ▶ $\text{Tr}_{\mathcal{H}_{\eta' \rightarrow \eta}} \rho_{\eta'} = \rho_{\eta}$

[Projective state spaces: Kijowski '76, Okołów '09 & '13]

Toy Model: Schrödinger Equation

Second quantization

$$\widehat{\mathcal{M}}_{\mathcal{I}'} \approx \widehat{\mathcal{M}}_{\mathcal{I}} \otimes (\widehat{\mathcal{I}^\perp} \cap \widehat{\mathcal{I}'})$$

$$\begin{array}{c} |(n_i)_{i \in \mathcal{I}'}\rangle \otimes |\psi\rangle_{\mathcal{T}} \\ \updownarrow \\ |(n_i)_{i \in \mathcal{I}}\rangle \otimes |\psi\rangle_{\mathcal{T}} \otimes |(n_i)_{i \in \mathcal{I}' \setminus \mathcal{I}}\rangle \end{array}$$

$\mathcal{I} \subset \mathcal{I}' \subset \mathcal{H}$
 $(e_i)_{i \in \mathcal{I}}$ ONB of \mathcal{I} , $(e_i)_{i \in \mathcal{I}'}$ of \mathcal{I}'

Usual quantization $\rightarrow \widehat{\mathcal{H}} \otimes \mathcal{T}$:

- ▶ Fock space $\widehat{\mathcal{H}}$ built from \mathcal{H}
- ▶ $\mathcal{T} = L_2(\mathbb{R}, d\mu_{\mathbb{R}})$

Alternative \rightarrow projective setup:

- ▶ $\widehat{\mathcal{M}}_{\mathcal{I}} = \widehat{\mathcal{I}} \otimes \mathcal{T}$
- ▶ $\widehat{\mathcal{M}}_{\mathcal{I}'} \approx \widehat{\mathcal{M}}_{\mathcal{I}} \otimes (\widehat{\mathcal{I}^\perp} \cap \widehat{\mathcal{I}'})$
 from $\widehat{\mathcal{I} \oplus \mathcal{J}} \approx \widehat{\mathcal{I}} \otimes \widehat{\mathcal{J}}$

Holonomy-Flux Algebra

Relation to the usual LQG Hilbert space (1)

$\psi \in \mathcal{H}_\gamma \subset \mathcal{H}_{\text{LQG}}$ defines a projective family $(\rho_\eta)_{\eta \in \mathcal{L}}$:

- ▶ choose η' with underlying graph γ' , such that $\eta \preceq \eta'$ and $\gamma \preceq \gamma'$
- ▶ $\psi \in \mathcal{H}_\gamma \subset \mathcal{H}_{\gamma'} \approx \mathcal{H}_{\eta'}$
- ▶ $\rho_\eta := \text{Tr}_{\eta' \rightarrow \eta} |\psi\rangle\langle\psi|$

There is an **injective** map from the space of density matrices on \mathcal{H}_{LQG} into the projective state space.

Holonomy-Flux Algebra

Relation to the usual LQG Hilbert space (2)

[LQG Hilbert space: Isham, Ashtekar, Lewandowski,...]

The map embedding the LQG state space in the projective one is **not surjective**.

We have states with narrow distribution for infinitely many holonomies:

- ▶ first step toward satisfactory coherent states
- ▶ but more work needed (restrict the label set...)

Loop Quantum Cosmology

$$n = m/k$$

$$m, n, k \in \mathbb{N}$$

Label set $\{n \in \mathbb{N}\}$:

- ▶ with order $n \mid m$
- ▶ less observables than on \mathcal{H}_{LQC}

The classical projections are covering maps:

- ▶ no factorization as Cartesian product of symplectic manifolds
- ▶ but a \otimes -projective structure still exists

Summary

- ▶ we can construct projective state spaces for LQG and LQC
- ▶ results obtained in fixed graph can be directly imported
- ▶ assembling is done with a different interpretation → η selects **observables**, not **states**
- ▶ enlarged state space → states that were not constructible on \mathcal{H}_{LQG} can be designed
- ▶ needed input for dealing with constraints → regularizing scheme + projections between the approximated theories

What next?

- ▶ good coherent states: more work needed (because of obstructions in the algebra itself) → cut down the label set...
[see also: Giesel & Thiemann '06]
- ▶ link between LQG and LQC → partly depends on progress in the previous point [see also: Engle '07]
- ▶ solving Gauss and diffeo constraints, ultimately even Hamiltonian constraint → by gluing together finer and finer discretizations?
- ▶ application to QFT → relation between regularization schemes considered here and renormalization techniques?
[see also: Dittrich '12]

Thank you!
