

Title: Towards holography via quantum source-channel codes

Date: Sep 20, 2017 04:00 PM

URL: <http://pirsa.org/17090066>

Abstract: <p>While originally motivated by quantum computation, quantum error correction (QEC) is currently providing valuable insights into many-body quantum physics such as topological phases of matter. Furthermore, mounting evidence originating from holography research (AdS/CFT), indicates that QEC should also be pertinent for conformal field theories. With this motivation in mind, we introduce quantum source-channel codes, which combine features of lossy-compression and approximate quantum error correction, both of which are predicted in holography. Through a recent construction for approximate recovery maps, we derive guarantees on its erasure decoding performance from calculations of an entropic quantity called conditional mutual information. As an example, we consider Gibbs states of the transverse field Ising model at criticality and provide evidence that they exhibit non-trivial protection from local erasure. This gives rise to the first concrete interpretation of a bona fide conformal field theory as a quantum error correcting code. We argue that quantum source-channel codes are of independent interest beyond holography.</p>

# Thermal CFT geometric interpretation

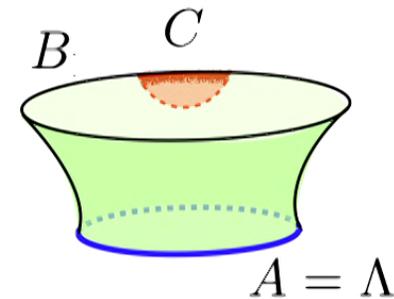

$$S_{ABC} = 0 \quad \Rightarrow \quad S(A : C|B) = S_C + S_{BC} - S_B$$

- BTZ black hole dual to CFT thermal state.
- No **proper** subspace supporting the thermal state.
- Interpret a CFT thermal state as a source-channel code.

# Calculate on your favorite CFT

Study conditional mutual information  
as a function of system size  $n$ .  
(lattice Hamiltonian)

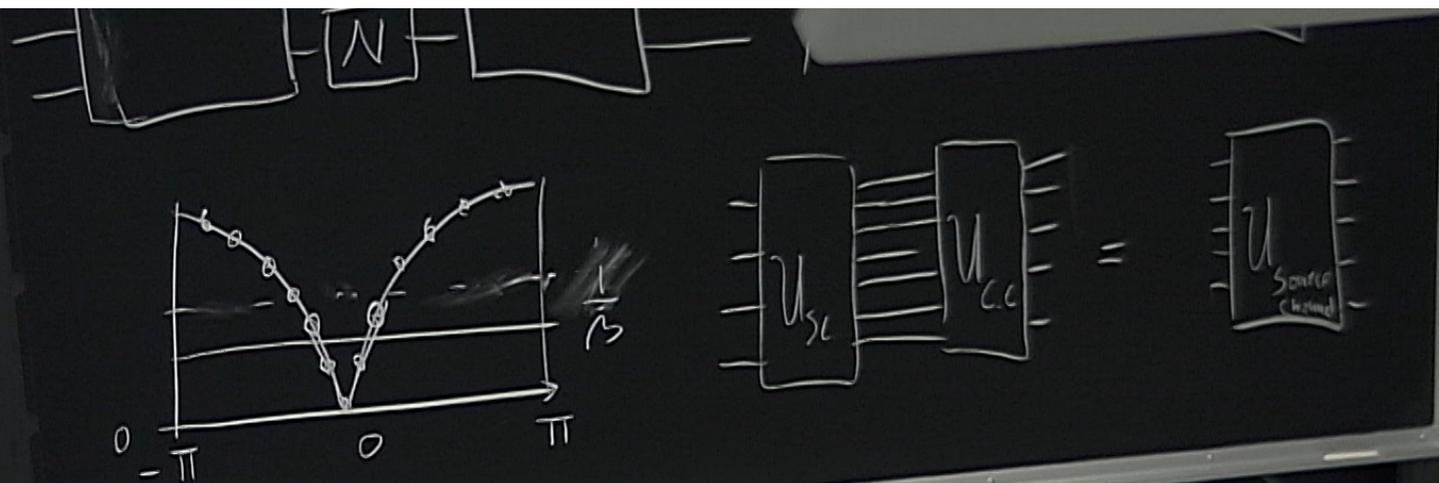

Constant temperature correspond to BH  
horizon a constant distance from boundary.

Scale inverse temperature with  $n$ .  $\beta \propto n^q$   $q \in (0, 1]$

For constant  $S(\rho_\beta)$  thermal entropy  $\beta \propto n$

Now calculate CMI on your favorite CFT!!!

Non-standard limit with comparable quantities.

$$S_c \approx |X_c|$$

$$S_{z,l} \approx S_l + \frac{c}{6} \log 2$$

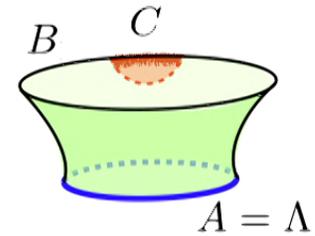

$$S_B = S_c + S_{BC}$$

CFT  $B_1, C, B_2$

# Critical transverse field Ising

$$H = \sum_{j=1}^n Z_j + X_j \otimes X_{j+1}$$

Equivalent to free fermions within given parity sector.

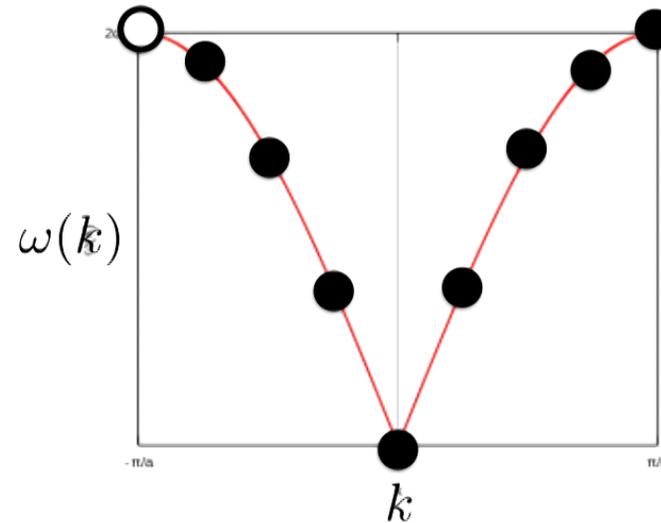

$$\rho_{BC} = \rho_{\text{even}}^{(\beta)} := \frac{P_{\text{even}} e^{-\beta H_{TF}}}{\text{tr} [P_{\text{even}} e^{-\beta H_{TF}}]}.$$

Free theory  $c=1/2$  hence not holographic.

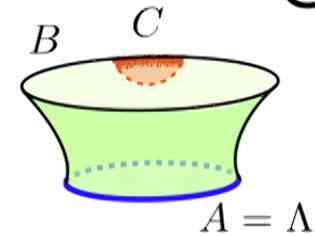

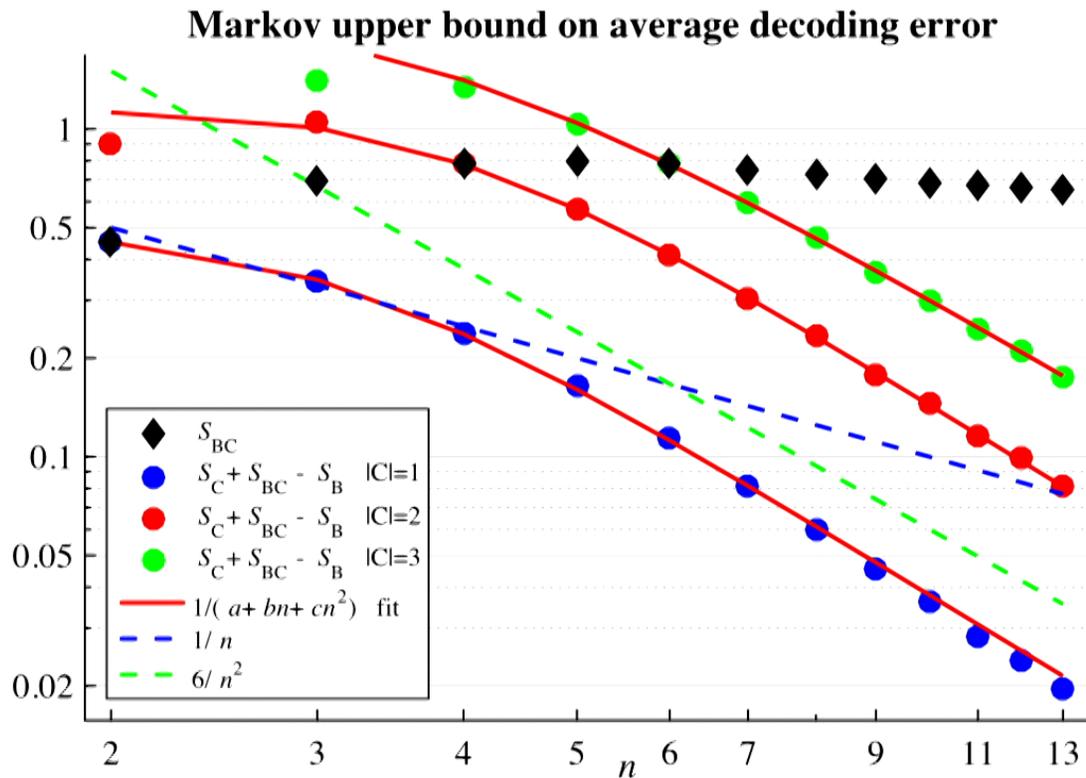

Dispersion relation:

$$\beta \propto n \quad \sim \text{constant } k$$

$$S(\rho_\beta)$$

# Critical transverse field Ising

$$\beta \propto n$$

$$\sim \text{constant } k$$

$$S(\rho_\beta)$$

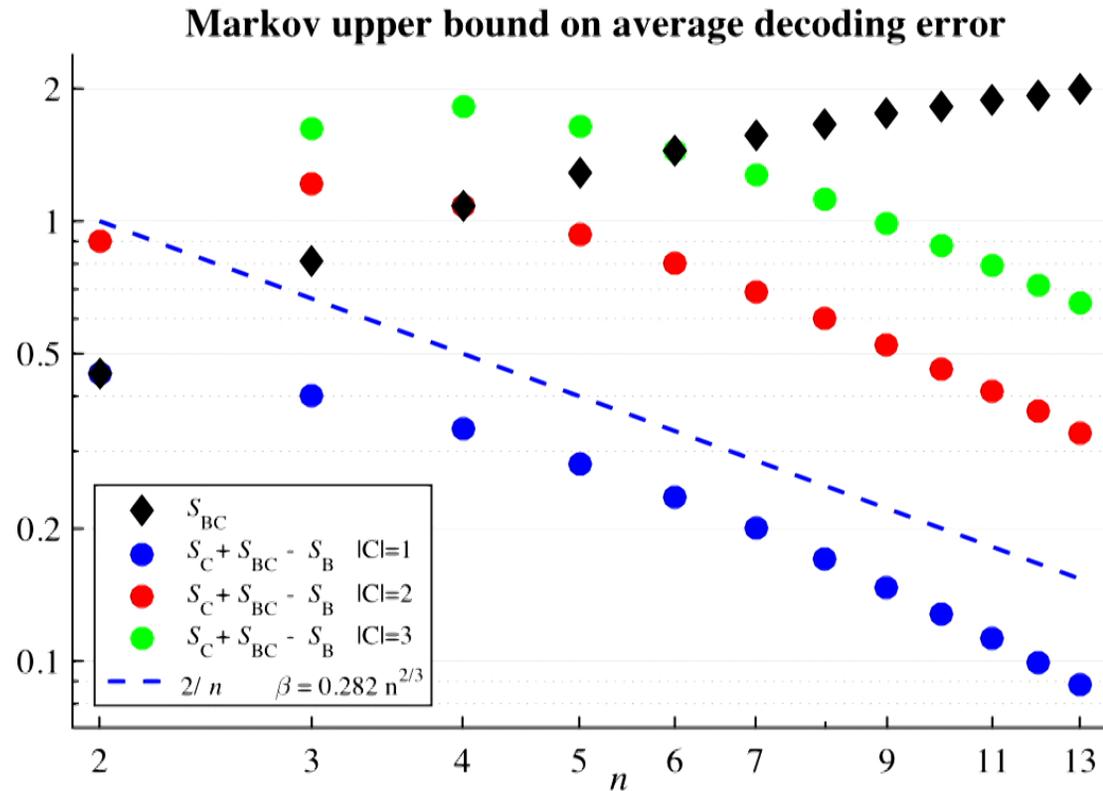

$$\text{constant } |C|$$

$$\epsilon \propto 1/n^2$$

Parity hack to forbid unphysical errors.

$$\rho_{BC} = \rho_{\text{even}}^{(\beta)} := \frac{P_{\text{even}} e^{-\beta H_{TF}}}{\text{tr} [P_{\text{even}} e^{-\beta H_{TF}}]}$$

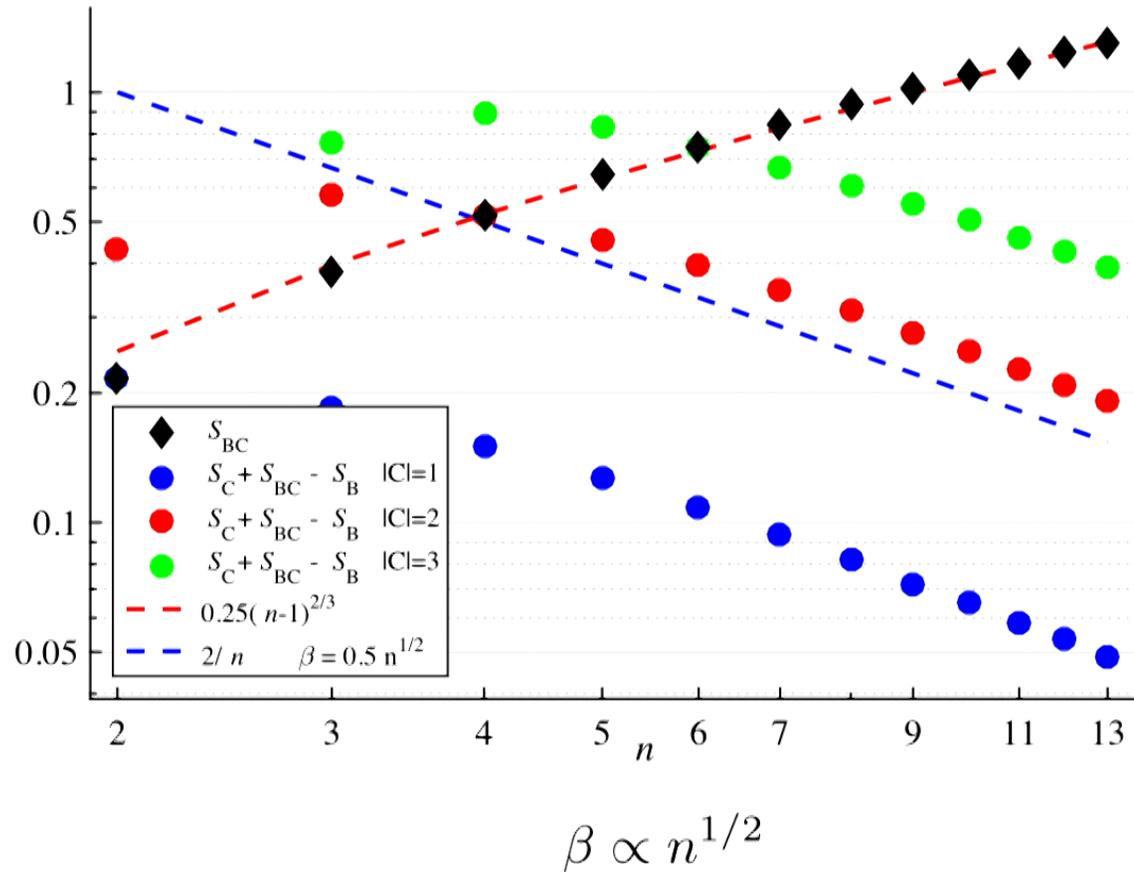

# Larger BH = more logical Inf.

$$\beta \propto n^{2/3}$$

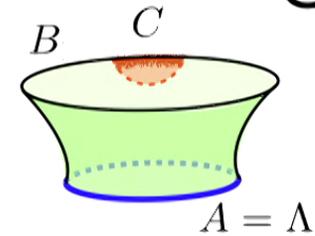

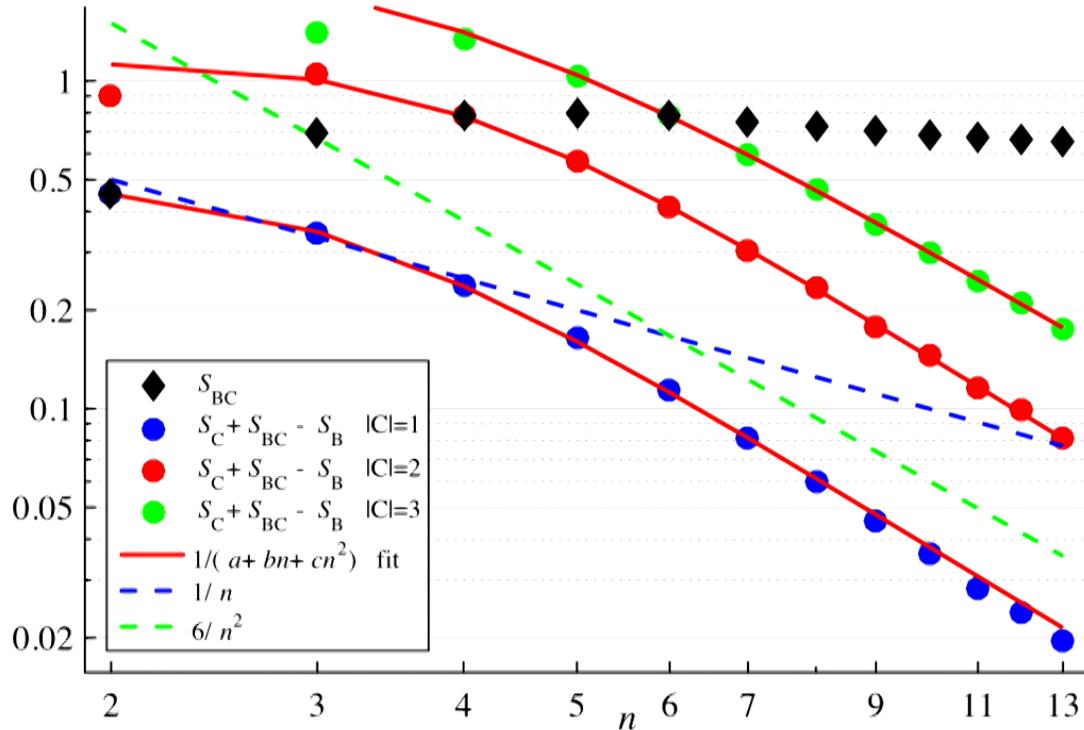

# Larger BH = more logical Inf.

Markov upper bound on average decoding error

# Critical transverse field Ising

Markov upper bound on average decoding error

$$\beta \propto n$$

$$\sim \text{constant } k$$

$$S(\rho_\beta)$$

$$\text{constant } |C|$$

$$\epsilon \propto 1/n^2$$

Parity hack to forbid unphysical errors.

$$\rho_{BC} = \rho_{\text{even}}^{(\beta)} := \frac{P_{\text{even}} e^{-\beta H_{TF}}}{\text{tr} [P_{\text{even}} e^{-\beta H_{TF}}]}$$
