

Title: Pauline Gagnon: Improbable Feats and Useless Discoveries

Date: Nov 08, 2017 07:00 PM

URL: <http://pirsa.org/17110066>

Abstract: As a child, Quebec native Pauline Gagnon dreamed of understanding what the universe was really made of.

As an adult, she studied exactly that, working at the largest experiment ever built, CERN's Large Hadron Collider. In her role as a Senior Research Scientist, based at Indiana University and working at CERN, she searched for dark matter particles in the decays of the famous Higgs boson, in the form of hypothetical particles called dark photons.

Now retired from active research, Gagnon is dedicated to inspiring other curious minds of all ages to ponder the same big questions that fascinated her as a child. Having worked in the CERN Communications group, she is adept at explaining the complex science of particle physics in engaging, comprehensible ways. She has delivered nearly 100 presentations to audiences in nine countries on three continents.

Gagnon's popular science book, *Who Cares about Particle Physics: Making Sense of the Higgs boson, the LHC and CERN*, not only explains current issues in particle physics but also explores the importance of fundamental physics in shaping not only our understanding of the universe, but in shaping society as well.

In her Perimeter Institute Public Lecture, Gagnon will explore the incredible (and improbable!) feats of ingenuity and cooperation that have led to one of humanity's greatest experiments, and why such pioneering research, albeit "useless" in terms of everyday practicality, has changed the way we live and is vital to our collective future.

Outline

- **What is particle physics?**
- **How do we manage to achieve what may seem impossible**
 - **How do we work?**
- **Finding useless particles: Why do we do it?**
- **What is left to do?**

Pauline Gagnon, retired, Indiana University and CERN

Aim of particle physics:

**Find the smallest building
building blocks of matter**

The Legoland version of Copenhagen

At Legoland, here are the fundamental particles

What are the smallest building blocks of matter?

An atom is a million times smaller than a hair

What are the smallest building blocks of matter?

What are the smallest building blocks of matter?

Protons and neutrons are made of quarks

Up :  (charge $+2/3$) and **down quarks:**  (charge $-1/3$)

Protons and neutrons are made of quarks

Up :  (charge $+2/3$) and **down quarks:**  (charge $-1/3$)

Proton:

Neutron:

Strong interaction	Electromagnetism	Weak interaction	Gravitation	Brout-Englert-Higgs field

www.particlezoo.net

Particles interact by exchanging other particles

How do these particles acquire a mass?

Tom Kibble, Gerald Guralnik, Carl Hagen, François Englert, Robert Brout, Peter Higgs

A mechanism to explain how particles acquire mass

This implied the existence of a new field

Particles acquire mass by interacting with this field

Magnetic field

To go further, we need three more concepts:

1. Mass:

resistance to motion

2. Energy and Mass are equivalent

$$E = m c^2$$

To go further, we need three more concepts:

1. Mass:

resistance to motion

2. Energy and Mass are equivalent

$$E = m c^2$$

3. Energy conservation

*Energy can take several forms
but its sum is always conserved*

2. How does this field generate mass?

Empty space, without a Brout-Englert-Higgs field

A

B

Space filled with the Brout-Englert-Higgs field

energy

=

movement

+

mass

By interacting with this field, some of the particle's energy is transformed into mass

The Higgs boson

17

The Higgs boson

Brout-Englert-Higgs field → surface of the ocean
The Higgs boson → like a wave

17

The Higgs boson

Brout-Englert-Higgs field → surface of the ocean
The Higgs boson → like a wave

Waves are excitations of the ocean surface
We can create Higgs bosons by exciting the BEH field

**Where was the
Higgs boson
found?**

CERN: European Laboratory for Particle Physics

12000 researchers from 63 countries

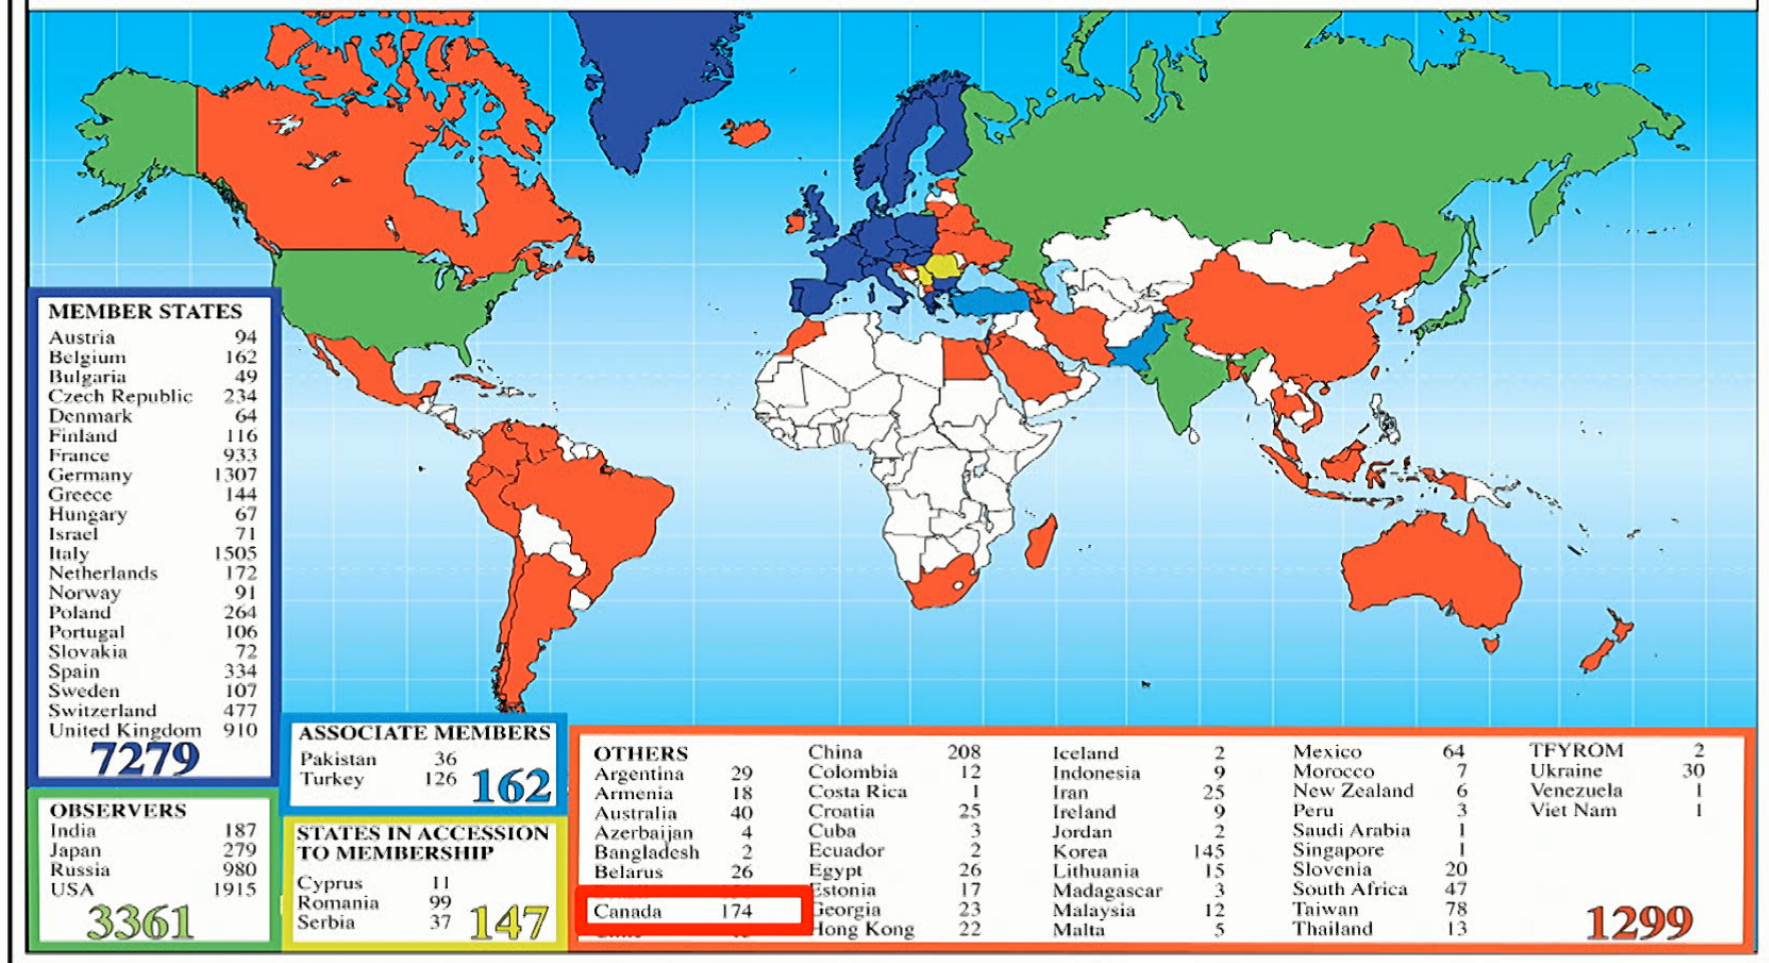

- Founded in 1954 by UNESCO
- Financed by its 22 member states (most of Europe, Israel)
 - Serbia, Cyprus, Slovenia, Turkey, Pakistan, Ukraine and India

Pauline Gagnon, retired, Indiana University and CERN

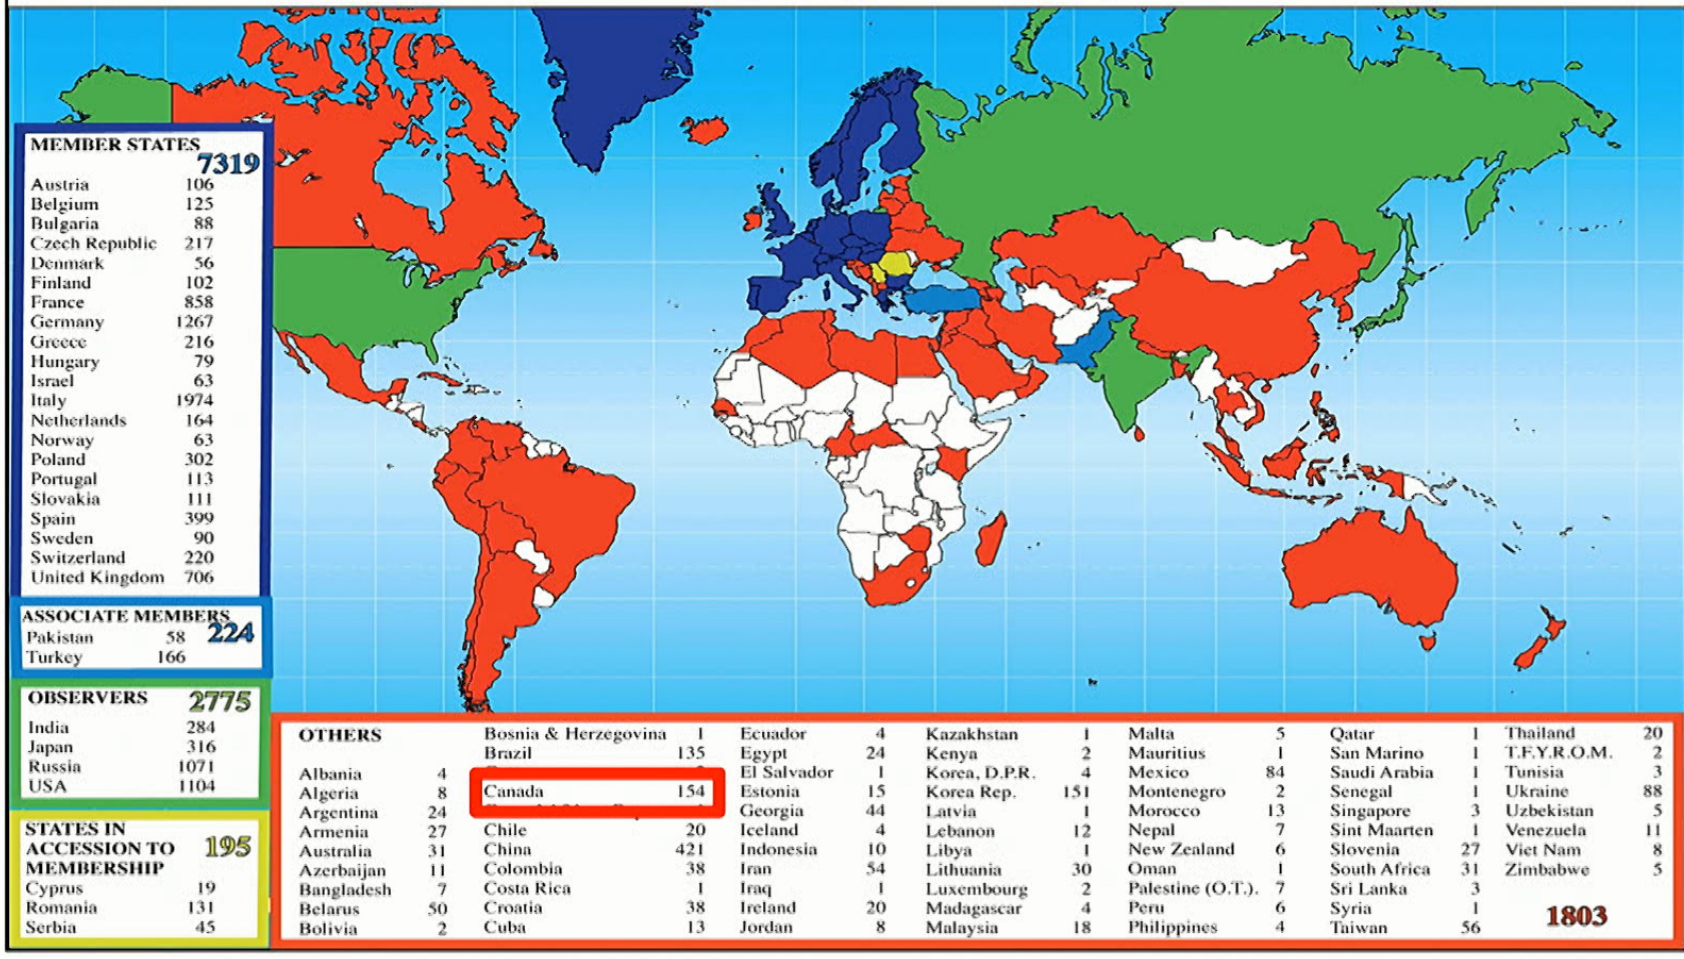

19

Distribution of All CERN Users by Location of Institute on 12 January 2016

Pauline Gagnon, retired, Indiana University and CERN

Distribution of All CERN Users by Nationality on 12 January 2016

A gathering of physicists at the Solvay Conference in 1927

Gender and racial diversity at CERN (2014)

At CERN, roughly 80% of all scientists are male and 80% are white

A large group of people, likely scientists and staff, are gathered in a massive industrial hall. In the background, a large, complex particle detector structure is visible, consisting of many layers of metal and electronic components. The hall has high ceilings and large windows. A yellow banner is overlaid on the image with text.

4 large experiments on the LHC: ATLAS, CMS, LHCb, ALICE

The Large Hadron Collider (LHC)

The energy released during the collisions materialises to form new particles:

$$E=mc^2$$

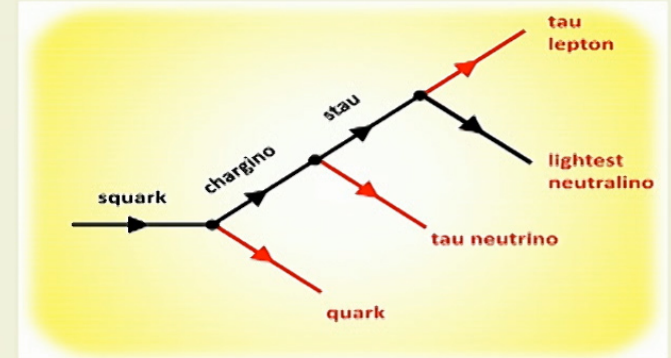

The ATLAS detector: like a giant camera

**Where do we
start?**

From theoretical predictions

- Sensitive to a variety of particles
- High granularity

- Sensitive in all directions
- Fast and precise

- Hermetic

First step: Technical Design

- The collaboration establishes what needs to be done
- The whole project is divided into sub-projects
- Each participating institute signs up for one of those projects
- Often times, several ideas are pursued in parallel

Pauline Gagnon, retired, Indiana University and CERN

34

Everyone can say what they think

- Everyone can suggest new ideas or methods
- Each one must prove his or her ideas are better
- The best method is selected based on its merit
- The common goal always has the last word, even when the coordinator disagrees

Pauline Gagnon, Indiana University

35

Decisions by consensus

- **Everything is discussed in meetings**
- **No top-down hierarchy**
- **No director, only coordinators**
- **Everyone chooses what they want to contribute**

Pauline Gagnon, retired, Indiana University and CERN

36

Everyone does as they please

- Like a huge picnic
- Each group volunteers for a task based on its taste and resources, and the needs of the experiment
- Each person must figure out how to contribute to make sure the whole project is successful

Pauline Gagnon, Indiana University

Everyone does as they please

- Like a huge picnic
- Each group volunteers for a task based on its taste and resources, and the needs of the experiment
- Each person must figure out how to contribute to make sure the whole project is successful

Pauline Gagnon, Indiana University

Motivation and creativity

Common goal: increase human knowledge

Individual benefits: participate in unique projects

- There are no bonus, no financial compensation
- The creative process is not blocked
- The whole project needs everyone's creativity

Collaboration and competition

- If one group fails, everyone fails
- Hence, we must help each other
- But we also compete for jobs

Pauline Gagnon, retired, Indiana University and CERN

We tested over 110 000 wires

Not obvious at the start...

41

... and 18 months later

Pauline Gagnon, retired, Indiana University and CERN

42

Brings out the best out of people

Pauline Johnson, retired, Indiana University and CERN

Maria and Giuseppe Fidecaro

44

How did we manage to make it work?

**Motivation
comes from
scientific
curiosity**

Success is shared

Pauline Gannon, reworded, Indiana University and CFAA

We will probably never find any practical application for the Higgs boson

Lifetime: 10^{-22} seconds

1. Increase human knowledge

2. Develop technology

Paulette Gagnon, retired, Indiana University and CERN

3. Train highly qualified people

4. Contribute to world peace through international collaboration

Benefits for Humanity?

New particles would reveal the secret passage to the bigger theory

Pauline Gagnon, retired, Indiana University and CERN

72

Take-home messages

- We can achieve incredible feats by getting the best out of highly motivated and diverse people who are allowed to do as they please
- There will probably never be any application for the Higgs boson but fundamental research drives economic development and has completely changed how we live
- Any new particle or new phenomenon found from now on will revolutionize our understanding of the Universe

Pauline Gagnon, retired, Indiana University and CERN
