

Title: On singularities of Super Conformal Field Theories

Date: Nov 14, 2017 02:30 PM

URL: <http://pirsa.org/17110106>

Abstract: Carefully studying the singularity structure of the moduli space of vacua of super conformal field theories, provides an incredibly powerful tool to extract information about such theories. In particular I will outline a concrete, yet technically challenging, strategy to go about carrying out a classification for SCFTs with extended supersymmetry in 4d.

I will explain in details how this classification has been worked out successfully for N=2 SCFTs in rank-1 and it is very promising in rank-2. And how with even higher Supersymmetry (N=3) we can obtain a classification valid for all ranks making a few reasonable, yet key, assumptions.

ON SINGULARITIES of Super Conformal Field Theories

Perimeter Institute 11/14/2017

in collaboration with **P. Argyres, F. Bonetti,**
C. Meneghelli, C. Long and L. Rastelli.

Mario Martone

INTRO

“Why the Study of Super Conformal Field Theories (SCFTs)?”

Mario Martone

Perimeter Institute - 11/14/2017

1/42

1. CFT'S are "Fundamental Bricks" of Effective Field Theory.
2. We have MORE TOOLS at our disposal.
3. We have already learned a LOT about QFT.

Goal of the Talk

UNDERSTAND the
SINGULARITY structure of the
CB/MODULI SPACE of 4d SCFTs
with rank HIGHER than 1
& 8 or MORE supercharges

Mario Martone

Perimeter Institute - 11/14/2017

3/42

the study of SINGULARITIES
can tell us a lot about the SPACE
of EXISTING 4d SCFTs
setting a TARGET
for EXPLICIT constructions

PART III "Exploring Rank-2"

PART IV "An Example In Details"

PART V " $N=3$ & $N=4$ Jury"

VECTOR MULTIPLY

Φ is a scalar which can acquire a VEV:

$$\Phi = \begin{pmatrix} a_1 \\ a_2 \\ \vdots \\ a_N \end{pmatrix}, \quad \sum_i^N a_i = 0$$

$\Phi \in \mathbb{C}^{N-1}$ & on the d/B $SU(N) \rightarrow U(1)^{N-1}$

In general (a_1, \dots, a_N) are NOT
 "gauge" invariant & we need to impose
 further identifications (e.g. Weyl Groups)

- $\dim_{\mathbb{C}} \text{CB} :=$ Rank of the Theory
- $(u_1, \dots, u_r) :=$ Coulomb Branch
coordinates.
- The geometry is **Singular**
@ \vec{u} 's where massless states appear.

\mathbb{C}^* -Action

- i] Φ has non-zero $U(1)_R$ charge.
- ii] In the scale-invariant case $\exists \mathbb{R}^+$ Action.

i & ii Combine into a \mathbb{C}^* -Action

Classification Steps

1. TOPOLOGY
2. GEOMETRY
3. DEFORMATION

Mario Martone

Perimeter Institute - 11/14/2017

10/42

TOPOLOGY

The SINGULAR Locus V

HAS to be

A Complex CO-DIMENSION 1

\mathbb{C}^* INVARIANT Set.

GEOIMETRY

- Define the Special Coordinates:

$$(a^i(\vec{u}), a^p_j(\vec{u})) \mid \frac{\partial a^p_j}{\partial a^i} = \tau_{ij}$$

- There is a Metric on the CB:

$$dS^2 = \text{Im}(da^p_i d\bar{a}^i)$$

• Imposing **SPECIAL KHÄLER** conditions:

$$\operatorname{Im} \tau_{ij} > 0, \tau_{ij} = \tau_{ji}$$

• Looping around the singularity:

$$\begin{pmatrix} \vec{a} \\ \vec{a}^\vee \end{pmatrix} \xrightarrow{\gamma} M \begin{pmatrix} \vec{a} \\ \vec{a}^\vee \end{pmatrix}, M \in \operatorname{Sp}(2r, \mathbb{Z})$$

DEFORMATION

HARDEST of All.

Perimeter Institute - 11/14/2017

15/42

Rank-1 Recap

for $SU(2)$ $\Phi = \begin{pmatrix} a & \\ & -a \end{pmatrix}$

- a is not gauge invariant **X**
- $u = \frac{1}{2} \langle \text{tr } \Phi^2 \rangle = a^2$ is **✓**

The **CB** is **1** Complex Dimensional

Rank-1 Recap

$$\begin{pmatrix} a \\ a^p \end{pmatrix} \xrightarrow[\gamma]{SL(2, \mathbb{Z})} M \begin{pmatrix} a \\ a^p \end{pmatrix} \quad \Bigg| \quad M = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in SL(2, \mathbb{Z})$$

Rank-1 Recap

singularities appear for values of the $\mathcal{C}\mathcal{B}$ parameter which allow extra massless states in the theory.

there needs to be 2 singularity within the curve

singularities might overlap & have non-zero multiplicity

Requering \mathbb{C}^* -invariance: $V \equiv \{0\}$

\mathbb{C} w/ deficit
angle δ

- Special Fuchsian conditions are trivially satisfied.
- E-M Duality only Allows **7** Values for the opening angle:

$$\left\{ \begin{array}{c|cccccccc} S & \pi/3 & \pi/2 & 2\pi/3 & \pi & 4\pi/3 & 3\pi/2 & 5\pi/3 & 2\pi \text{ (cusp)} \\ \Delta(a) & 6 & 4 & 3 & 2 & 3/2 & 4/3 & 6/5 & \infty \end{array} \right\}$$

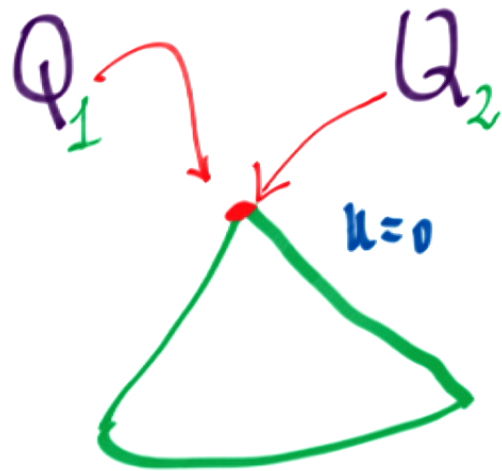

They correspond to the **KODAIRA** class.

Name	curve ($y^2 = \dots$)	$\Delta(u)$	M_0	#
II^*	$x^3 + u^5$	6	ST	10
III^*	$x^3 + u^3x$	4	S	9
IV^*	$x^3 + u^4$	3	$-(ST)^{-1}$	8
I_0^*	$x^3 + u^2x + gu^2$	2	-1	6
IV	$x^3 + u^2$	$3/2$	$-ST$	4
III	$x^3 + u^2x$	$4/3$	S^{-1}	3
II	$x^3 + u$	$6/5$	$(ST)^{-1}$	2

Perimeter Institute - 11/14/2017

23/42

IMPORTANT

- Most theories are *Non-Lagrangian*
- Many *don't* have an *S-class* description!

Mario Martone

Perimeter Institute - 11/14/2017

24 / 42

Rank 2: $\dim CB = 2, \dim V = 1$

$$(u, v) \rightarrow (\lambda^{\Delta_u} u, \lambda^{\Delta_v} v)$$

Thus V can be:

- $u = 0$

- $v = 0$

- $u^p / v^q = \omega = \omega_0$

$$\begin{array}{l} \Delta_u = rp \quad \Delta_v = rq \\ \hline \gcd(p, q) = 1, r \in \mathbb{Q} \end{array}$$

To help visualizing:

$$X_\rho := V \cap S_\rho, \quad S_\rho := \{|u|^\rho + |v|^\rho = 2\varepsilon^\rho\}$$

e.g. • $\{u=0\} \cap S_0 := K_0(u,v)$

$$K_0(u,v) := \{(u,v) \in \mathbb{C}^2 \mid u=0, v=e^{i\phi}\}$$

Define:

$$\bullet \{u^p/v^q = 1\} \cap S_0 := K_{(p,q)}(u,v)$$

$$\text{On } K_{(p,q)}(u,v) \rightarrow |u| = |v| = 1$$

Thus:

$$K_{(p,q)} := \{u = e^{i\theta}, v = e^{i\psi} \mid p\theta = q\psi\}$$

$K_{(p,q)}$ is a Torus (p,q) link.
with Unknots.

Mario Martone

Perimeter Institute - 11/14/2017

29/42

Special Kähler conditions & the way $Sp(4, \mathbb{Z})$ monodromies tie with scale invariance, strongly constrain the Analytic behaviour of (\vec{a}, \vec{a}_s)

Assuming no Unknots

(u, v) can only have one of the

following Leading Dimensions

$\{1, \frac{12}{11}, \frac{10}{9}, \frac{8}{7}, \frac{6}{5}, \frac{4}{3}, \frac{10}{7}, \frac{3}{2}, \frac{8}{5}, \frac{5}{3}, \frac{12}{7}, 2, \frac{12}{5}, \frac{5}{2}, \frac{8}{3}, 3, \frac{10}{3}, 4, 5, 6, 8, 10, 12\}$

SU(3)

$$\Phi = \begin{pmatrix} a \\ b \\ c \end{pmatrix}, \quad a+b+c=0$$

INVARIANT COORDINATES

$$u = ab + bc + ac$$

$$v = abc$$

Where are the Singularities?

SU(3) w/ 1 adj. [$\mathcal{N}=4$]

Unbroken SU(2): $\Phi = \begin{pmatrix} a \\ a \\ -a \end{pmatrix}$

$$\mu^3 = v^2$$

In the $\mathcal{N}=4$ case the singularity is
a Tangle (3,2) knot.

SU(3) w/ 6 Flavours.

i] Unbroken SU(2) @ $\mu^3 = v^2$

ii] Massless Quarks @ $v = 0$

What about Non Perturbative Effects?

- i] In the Deep-Fi Quarks decouple.
- ii] The $SU(2)$ has a Monopole-Dyon singularity!
- iii] The Splitting Depends on the scale a !

$$\mu^p = v^q \rightarrow \mu^p = \omega_{1,2} v^q$$

IMPORTANT

i] $\mathcal{N}=4$ V IS An Orbifold

ii] $\mathcal{N}=2$ V IS NOT!

PART V

"N=3 & N=4 Jussy"

Mario Martone

Perimeter Institute - 11/14/2017

38/42

For 9 or more supercharges the
Moduli space \mathcal{M} is FLAT.

Can we prove that

$$\mathcal{M} \simeq \mathbb{C}^{3r} / \Gamma$$

Let's Assume it for now...

On a $N=2$ Coulomb Branch Slice

- Freely generated CB Chiral Ring:

Γ COMPLEX REFLECTION

- Flatness $\Rightarrow \begin{pmatrix} \vec{a} \\ a_D \end{pmatrix} \sim \begin{pmatrix} \vec{z} \\ z' \end{pmatrix}, (z, z') \in \mathbb{C}^{2r}$

- Monodromies in $Sp(4, \mathbb{Z})$:

Γ CRYSTALLOGRAPHIC

CRYSTALLOGRAPHIC COMPLEX REFLECTION GROUPS

Have been *Fully* classified so
we have a full list of $N=3$
Geometries!

Mario Martone

Perimeter Institute - 11/14/2017

41/42

- We Find many **NEW** Geometries already at Rank-2.

Still working out the physical properties.

STAY TUNED.

CONCLUSIONS

1. The classification of $N=2$ CB seems to be extensible to *Higher Ranks*.
2. For $N=3$ & $N=4$ there seems to be a *Full* answer for *All* Ranks.
3. Getting away from the scale-invariant limit is the *Hard* part.

THANK YOU!
