

Title: Chad Hanna, Pennsylvania State University

Speakers: Chad Hanna

Collection: Perimeter Public Lectures

Date: April 03, 2019 - 7:00 PM

URL: <http://pirsa.org/19040089>

Abstract: For thousands of years, astronomy was restricted to what we could see with our eyes. But visible light makes up only a tiny fraction of a spectrum emitted by celestial objects.

We now know that light is not the universe's sole means to reveal the mysteries of the heavens. Until recently, we simply lacked the windows through which to view these aspects of our universe.

Over the last few decades, astronomers have revolutionized our windows on the universe with telescopes of unprecedented sensitivity to light beyond what we can see with our eyes.

Observatories now allow us to see ghostly particles called neutrinos, and ripples in the fabric of space itself - called gravitational waves.

In his Perimeter Public Lecture on April 3, 2019, Chad Hanna will describe how these new windows have changed our view of the cosmos and explore what new wonders may be unveiled in the decades to come.

Hanna is an associate professor at Pennsylvania State University. His research focuses on studying the universe with gravitational waves using the Laser Interferometer Gravitational-Wave Observatory (LIGO).

Hanna and his research group work to enable multi-messenger astronomy through gravitational wave observations of merging neutron stars and black holes. Prior to joining Penn State, he was a senior postdoctoral researcher at Perimeter Institute.

# Outline

- A brief history of astronomy
- The ~20th century revolution - discovery of electromagnetic spectrum, quantum mechanics, relativity, predictions of compact objects, the neutrino, etc
- Pushing the boundaries with new instruments, etc
- SN1987a
- GW170817
- TXS
- What we learn?
- The potential and prospects
