

Title: Discussion: Where in the Cosmos should we look for novel physics?

Speakers: Elias Kiritsis

Collection: Cosmological Frontiers in Fundamental Physics 2019

Date: September 03, 2019 - 4:00 PM

URL: <http://pirsa.org/19090057>

Perimeter, September 3, 2019

DISCUSSION SESSION

*Where in the Cosmos should we
look for novel physics?*

Coordinator: Elias Kiritsis (APC and U. of Crete)

1-

The interplay

- Experiment/Observation
- Theory/understanding

Where in the Cosmos should we look for novel physics?,

Elias Kiritsis

2

Theory: conceptual issues

- What is the “nature” of gravity?
- The cosmological constant and/or “dark energy” problem.
- Embedding Inflation in a “fundamental” theory.
- What is dark matter?
- How is the baryon asymmetry of the universe generated?
- And a related particle physics issue: Why is there a large hierarchy between known particle physics and gravity?

Where in the Cosmos should we look for novel physics?,

Elias Kiritsis

3

Theory: conceptual issues

- What is the “nature” of gravity?
- The cosmological constant and/or “dark energy” problem.
- Embedding Inflation in a “fundamental” theory.
- What is dark matter?
- How is the baryon asymmetry of the universe generated?
- And a related particle physics issue: Why is there a large hierarchy between known particle physics and gravity?

Where in the Cosmos should we look for novel physics?,

Elias Kiritsis

3

What is the “nature” of gravity?

- Gravity is an effective theory.
- There are good reasons to believe that the UV degrees of freedom of gravity *are not* gravitons.
- In (perturbative) string theory, gravity has a cutoff $\ll M_P$
- AdS/CFT (holography) is telling us that gravity in string theory is “composite” at high-energies: the graviton (and other fields) are composites of (generalized) gluons.
- Many argue that the high-energy physics of gravity is irrelevant for observation.
- Although this may be true, the holographic idea tells us interesting things about the low-energy theory, especially what is natural and what is not.

- For example the early universe cosmology can be described in a non-geometric formulation of “gravity”

Skenderis+McFadden, Afshordi

- As another example, the dynamics in (near) de Sitter space may have stability or fine-tuning properties that are different from what low-energy gravity suggests.

- There may be constraints on gravitational physics+matter that are not obvious from the effective theory (Swampland constraints).

Vafa+Ooguri

- For example, current efforts seem to imply that **pure gravity does not have a consistent UV Completion.**

- There are current efforts to understand how the graviton can be composite at high energy but look featureless at low energies.

Betzios+EK+Niarchos

- In all these cases, the long distance nature of gravity seems to become different from flat space gravity, but without the problems of massive gravity.

Where in the Cosmos should we look for novel physics?,

Elias Kiritsis

4-

The cosmological constant and dark energy

- This appears as the most serious fine tuning problems in physics.

There are several ideas on its resolution

- The “just so” idea (aka the anthropic resolution).
- ♠ Interesting recent proposal on how to test experimentally this solution
Csaki+Belazzini et al.
- ♠ That may require a synergy between Nuclear and particle physics (Fair) to pin down the equation of state of cold nuclear matter at high density, and GW observations of neutron star mergers.
- The “fine tuning” between two sectors, one observable and the other hidden.
see eg. Latham's talk
- ♠ This may be implementable in theories where gravity emerges from hidden sectors.

- ♠ I am not aware of possible experimental tests.
- The possibility that all **masses are due to spontaneous symmetry breaking** of a near conformal theory.
- ♠ Difficult to realize and difficult to test.
- The **self-tuning mechanism of the cosmological constant**.
- ♠ Implementable in higher-dimensional models of gravity where the SM lives on a domain wall.
*Arkani-Hamed+Dimopoulos+Kaloper+Sundrum,
 Kachru+Schulz+Silverstein,Burgess+Quevedo+Tasinato+Zavalla*
- ♠ A working version was proposed recently. **The graviton is ALWAYS massive on the brane.**
Charmousis+EK+Nitti
- ♠ Interestingly, the brane-world setup is **the holographic dual of emergent gravity from hidden sectors**.

Where in the Cosmos should we look for novel physics?,

Elias Kiritsis

5-

Inflation

- We have a working effective theory and remarkable data!
- It seems difficult to be incorporated in a fundamental theory without fine tuning.
- There are even [swampland conjectures](#) that attempt to say it is impossible! (but they apply only in weakly coupled/weakly curved setups).
- We are missing an important datum ([inflationary gravitational waves](#)). It is crucial for determining the energy scale of inflation.
- This is one of the holy-grails of modern cosmology.

- (small) experiments that attempt to understand the (very complex) physics of the polarisation of the “background” are of paramount importance.

- There may be other observable features of inflation that may become accessible in the near or far future.

Linking them to features of the theory seems important.

- Embedding inflation is correlated crucially with any mechanism for a small late cosmological constant.

Where in the Cosmos should we look for novel physics?,

Elias Kiritsis

6-

Observations

♠ We have at hand an unprecedented **four windows** into the universe

- **EM over all frequencies**
- Neutrinos (getting there).
- **Cosmic radiation (particles)**
- Gravitational Waves.

But, many questions demand time-consuming and costly instruments.

1 Possible source for discovery of new physics?
CNB direct detection and mass measurements

Some thoughts:
CNB decouples at $a/a_0 \sim 10^9$
→ Late/end inflation dynamics
Would rapid oscillations during preheating/reheating generate density fluctuations that impact uniformity of CNB or momentum tails?
Are D photodisintegration rates more tightly coupled to photons and thus make BBN less dependent on CNB uniformity/momenta?
→ Modification to late-time expansion rates
Are S_8 observables modified by shifts in the non-relativistic transition(s) of CNB?
→ Fits to Ω_{ν} compared with Direct Neutrino Masses

Talk Friday: "CNB Detection and Neutrino Mass Measurements with PTOLEMY"
Chris Tully (Princeton University)

2 PTOLEMY CNB/Mass/Sterile Physics

High Mass Target ($\sim 6-10$ eV) Low Mass Target ($\sim 2-4$ eV)

Formation of shocks

Simple model of the early universe:

- Flat FLRW cosmology
- Small growing (nearly) conformal perturbations

In a radiation fluid, shocks form after $\sim \epsilon^{-1}$ oscillations, with ϵ the rms fractional density perturbation. Typically $\epsilon \sim 10^{-4} - 10^{-1}$.

This can lead to

- Gravitational waves
- Out of equilibrium
- Vorticity
- Entropy

which are protected in linear perturbation theory.

3 (3 of 16) 229%

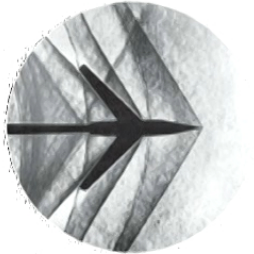

Time window

Shocks form when the shock width < steepening scale.

- In a radiation fluid, the shock width is

$$L_s = 9\sqrt{2}\eta/(\epsilon\rho)$$

with η the shear viscosity.

- Steepening takes place at scales ϵH^{-1} , with H the Hubble parameter
- While $T > 100\text{GeV}$, the viscosity $\eta \sim 400 T^3$
- During neutrino decoupling $\eta \sim v^4/T^5$ with v the Higgs field vev

Time window:

- For $\epsilon = 10^{-4}$: shocks form while $10^7\text{GeV} < T < 1\text{GeV}$
- For $\epsilon = 10^{-1}$: shocks form while $10^{13}\text{GeV} < T < 100\text{MeV}$

Non-linearities in equation of motion

The energy-momentum tensor

$$T^{\mu\nu} = (\rho + p)u^\mu u^\nu + pg^{\mu\nu} = \frac{4}{3}\rho u^\mu u^\nu + \frac{1}{3}\rho g^{\mu\nu}, \quad u_\mu u^\mu = -1,$$

with $\eta^{\mu\nu} = \text{diag}(-1, 1, 1, 1)$, $P = \frac{1}{3}\rho$, $c_s = \frac{c}{\sqrt{3}}$

Equations of motion

$$0 = \rho(\partial_t \mathbf{v} + (\mathbf{v} \cdot \nabla) \mathbf{v}) + \frac{1}{4}(1 - \mathbf{v}^2)(\nabla \rho + \mathbf{v} \partial_t \rho),$$

$$0 = \partial_t(\rho^{3/4} \gamma_v) + \nabla \cdot (\rho^{3/4} \gamma_v \mathbf{v}),$$

with $u^\mu = \gamma_v(1, \mathbf{v})$ and $\gamma_v = (1 - \mathbf{v}^2)^{-\frac{1}{2}}$.

Three-dimensional simulations

A 1024^3 simulation with $\epsilon = 0.1$.

The image displays a 3D simulation of a shock wave or turbulent flow. The visualization is a grayscale, noisy texture that appears to be a cross-section or a surface map of a complex, irregular structure. The texture is composed of many small, light-colored, irregular shapes against a darker background, creating a highly detailed and somewhat chaotic appearance. A small mouse cursor is visible near the center of the image, indicating it is interactive.

Three-dimensional simulations

A 1024^3 simulation with $\epsilon = 0.1$.

The image displays a 3D simulation of a complex, filamentary structure, likely representing a cosmic web or shock waves. The structure is composed of numerous thin, interconnected filaments and sheets, creating a dense, web-like appearance. The color scheme is dark with bright, glowing highlights, emphasizing the intricate details of the simulation.

Gravitational Cherenkov radiation

The intersection point moves with

$$v_x = \frac{c_s}{\sin \theta}.$$

Faster than speed of light when

$$\theta < \sin^{-1} \left(\frac{c_s}{c} \right) \approx 35^\circ.$$

This leads to gravitational radiation.

Summary

Shock waves in the early universe:

- The early universe contained shock waves $10^7 \text{ GeV} < T < 1 \text{ GeV}$, for $\epsilon = 10^{-4}$
- Gravitational waves
- Vorticity
- Entropy

Detailed numerical calculations are in progress.

The image shows a screenshot of a presentation slide titled 'Summary' in red. The slide discusses shock waves in the early universe, listing four bullet points: 1) The early universe contained shock waves $10^7 \text{ GeV} < T < 1 \text{ GeV}$ for $\epsilon = 10^{-4}$; 2) Gravitational waves; 3) Vorticity; 4) Entropy. It also states that detailed numerical calculations are in progress. To the right of the text is a visualization of shock waves, showing a complex, interconnected network of bright, filamentary structures against a dark background. The presentation is viewed in Adobe Acrobat Pro, with the file name 'PresentatieShockWaves.pdf' visible in the title bar. The Windows taskbar at the bottom shows several open applications, including 'Inbox - Local Folders...', 'WinEdt/MIKTeX - [C:\...', 'HEP - INSPIRE-HEP - ...', 'Downloads', 'other', and 'PresentatieShockWav...'. The system clock indicates the time is 23:49 on Tuesday, 03-Sep-19.

Why is the Electric Dipole Moment of the Neutron Small?

The Strong CP Problem and the QCD axion

Neutron
EDM

$$\frac{g_s^2}{32\pi^2} \theta_s \vec{E}_s \cdot \vec{B}_s$$

$$\text{EDM} \sim e \text{ fm } \theta_s$$

Experimental bound: $\theta_s < 10^{-10}$

Why is the Electric Dipole Moment of the Neutron Small?

The Strong CP Problem and the QCD axion

Neutron
EDM

$$\frac{g_s^2}{32\pi^2} \theta_s \vec{E}_s \cdot \vec{B}_s$$

$$\text{EDM} \sim e \text{ fm } \theta_s$$

Experimental bound: $\theta_s < 10^{-10}$

Solution:

$\theta_s \propto a(x,t)$ is a dynamical field, an axion

Axion mass from QCD:

$$\mu_a \sim 6 \times 10^{-11} \text{ eV} \frac{10^{17} \text{ GeV}}{f_a} \sim (3 \text{ km})^{-1} \frac{10^{17} \text{ GeV}}{f_a}$$

f_a : axion decay constant

Give rise to a plenitude of massless particles in our Universe

A Plenitude of (Almost) Massless Particles

- Spin-0 non-trivial gauge field configurations: **String Axiverse**
- Spin-1 non-trivial gauge field configurations: **String Photiverse**
- Fields that determine the shape and size of extra dimensions as well as values of fundamental constants: **Dilatons, Moduli, Radion**

What If DM Is a Boson and Very Light?

Dark Matter Particles in the Galaxy

Usually we think of ...

like a WIMP

What If DM Is a Boson and Very Light?

Dark Matter Particles in the Galaxy

Usually we think of ...

like a WIMP

instead of...

$$\lambda_{DM} = \frac{\hbar}{m_{DM}v}$$

What If DM Is a Boson and Very Light?

Dark Matter Particles in the Galaxy

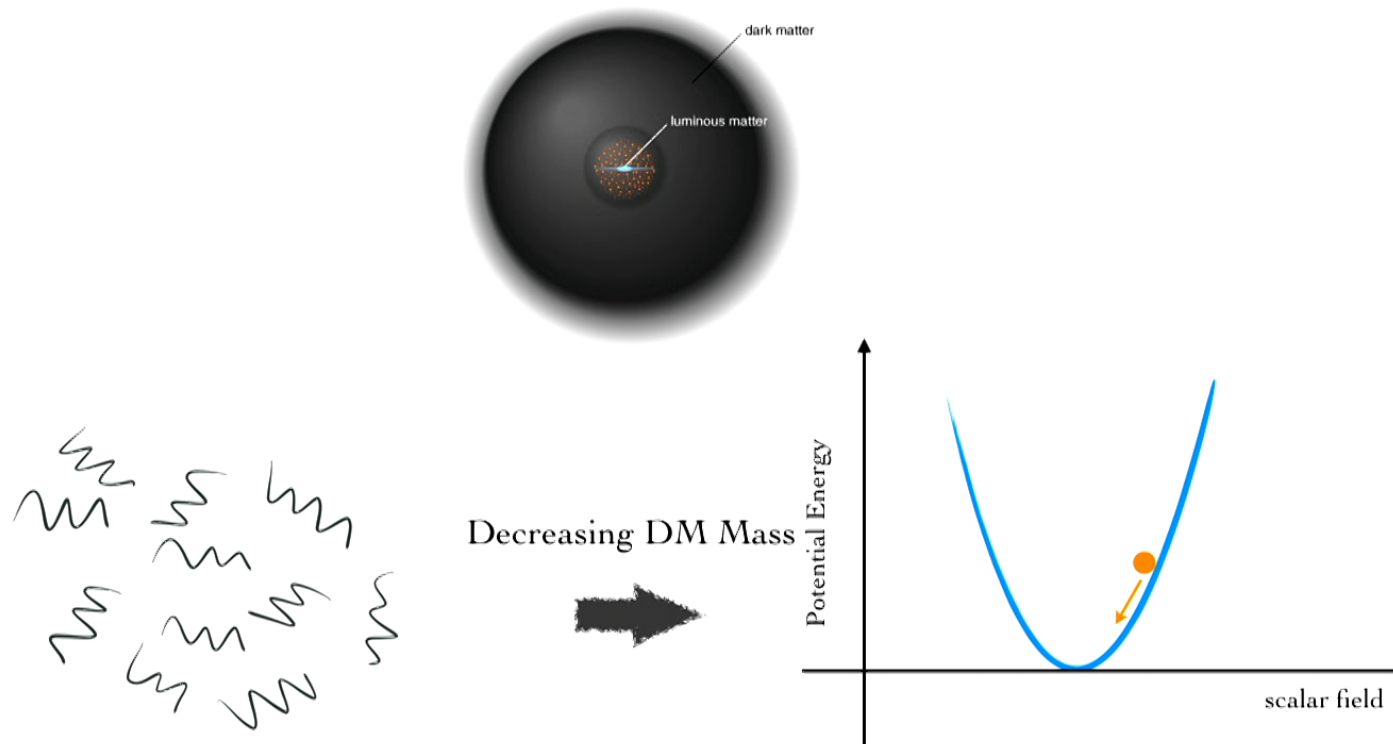

Decreasing DM Mass

What If DM Is a Boson and Very Light?

Dark Matter Particles in the Galaxy

Equivalent to a Scalar Wave

Going from DM particles to a DM “wave”

$$\text{When } n_{DM} > \frac{1}{\lambda_{DM}^3}$$

In our galaxy this happens when $m_{DM} < 1 \text{ eV}/c^2$

we can talk about DM $\phi(x,t)$ and locally

$$\phi(t) \approx \phi_0 \cos \omega_{DM} t$$

with amplitude

$$\phi_0 \propto \frac{\sqrt{\text{DM density}}}{\text{DM mass}}$$

with frequency

$$\omega_{DM} \approx \frac{m_{DM} c^2}{\hbar}$$

and finite coherence

$$\delta\omega_{DM} \approx \frac{m_{DM} v^2}{\hbar} = 10^{-6} \omega_{DM}$$

Light Scalar Dark Matter

- Just like a harmonic oscillator

$$\ddot{\phi} + 3 H \dot{\phi} + m_{\phi}^2 \phi = 0$$

$$\ddot{x} + \gamma \dot{x} + \omega^2 x = 0$$

Frozen when:
Hubble $>$ m_{ϕ}

Initial conditions set by inflation

*The story changes slightly if DM is a dark photon

Axion Dark Matter and the Large Misalignment Mechanism

Axions generically have attractive self-interactions

Axion self-interactions affect evolution at $H \sim m$

Structure growth due to axion self-interactions

Attractive self-interactions boost scales of size

$\lambda^* \sim 2\pi/m$ at the time of oscillation

corresponding today to:

$$0.69 \text{ Mpc} \sqrt{10^{-22} \text{ eV}/m}$$

or mass of:

$$M_s^* = \frac{4\pi\rho_{\text{DM}}^0}{3} \left(\frac{\lambda_*}{2}\right)^3 \approx 5 \times 10^9 M_\odot \left[\frac{10^{-22} \text{ eV}}{m}\right]^{3/2}$$
