We present a generalization to 3-qubits of the standard Bloch sphere representation for a single qubit and of the 7-dimensional sphere representation for 2 qubits presented in Mosseri *et al.*<sup>1</sup>. The Hilbert space of the 3-qubit system is the 15-dimensional sphere  $S^{15}$ , which allows for a natural (last) Hopf fibration with  $S^8$  as base and  $S^7$  as fiber. A striking feature is, as in the case of 1 and 2 qubits, that the map is entanglement sensitive, and the two distinct ways of un-entangling 3 qubits are naturally related to the Hopf map. We define a quantity that measures the degree of entanglement of the 3-qubit state. Conjectures on the possibility to generalize the construction for higher qubit states are also discussed.

## I. INTRODUCTION

Quantum mechanics exhibits its difference from classical physical theories in many aspects. A quintessential property of quantum mechanics is quantum entanglement. Quantum entanglement rests at the center of the applications such as quantum information and quantum computing. Maximally entangled EPR pair<sup>2</sup> is an essential ingredient of teleportation<sup>4</sup>, dense coding<sup>3</sup>, and quantum key distribution<sup>5,6</sup>. The maximally entangled 3-qubit GHZ state<sup>7</sup> and the  $m$ -cat state are of cardinal importance to the applications such as cryptographic conferencing or superdense coding<sup>8</sup>, quantum secret sharing or quantum information splitting<sup>9</sup>. Due to the entanglement of the Hilbert space states, it is a highly non-trivial problem to understand the properties of multi-qubit states. Recently, it has become clear<sup>1</sup> that the properties of the first two simplest qubit states, the single qubit and the 2-qubit state, are very deeply related to two very important mathematical objects, the first two Hopf fibrations  $S^3 \xrightarrow{S^1} S^2$  and  $S^7 \xrightarrow{S^3} S^4$ . The global phase freedom of the single qubit state and the entanglement which appears for the first time starting with the 2-qubit case have been proven to be deeply related to the Hopf fibrations. For an entangled 2-qubit state, performing a transformation on the first qubit space induces a transformation on the space of the second qubit space. This
