Title: The Markov gap for geometric reflected entropy

Speakers: Jonathan Sorce

Series: Perimeter Institute Quantum Discussions

Date: November 17, 2021 - 3:30 PM

URL: https://pirsa.org/21110037

Abstract: This talk concerns the "Markov gap," a tripartite-entanglement measure with a simple geometric dual in holographic quantum gravity. I will prove a new inequality constraining the Markov gap of classical states in quantum gravity, and interpret this inequality as a lesson about multipartite entanglement in holography. I will also speculate about signatures of the inequality in non-holographic field theories, and conjecture a new universal entanglement feature of two-dimensional CFTs.

Bipartite and tripartite entanglement in holography

Introduction and Motivation

000

## Ryu-Takayanagi is not enough!

■ The von Neumann entropy only depends on a bipartition of the boundary state, so it can't tell us anything about multipartite entanglement.

■ If we want to understand the rich structure of holographic entanglement, we need more detailed entanglement measures.

Reflected entropy and its properties

# Canonical purifications

#### Defining the canonical purification

Given a density matrix  $\rho$ , write

$$\rho = \sum_{j} p_{j} |j\rangle\langle j|.$$

Define  $|\psi_{\rho}\rangle \equiv \sum_{j} \sqrt{p_{j}} |j\rangle |j\rangle$ .

#### Example

If  $\rho = \frac{1}{Z} \sum_{j} e^{-\beta E_{j}} |E_{j}\rangle\langle E_{j}|$  is thermal, then

$$|\psi_{\rho}\rangle = \frac{1}{\sqrt{Z}} \sum_{j} e^{-\beta E_{j}/2} |E_{j}\rangle |E_{j}\rangle \equiv |\mathsf{TFD}\rangle.$$

# Canonical purifications in gravity

Dutta and Faulkner used the gravitational path integral to argue that for a holographic state, the canonical purification is obtained by sewing two copies of the bulk together along their spatial boundaries. (Think of the black hole  $\rightarrow$  TFD sewing.)

## Back to the entanglement wedge cross-section

Let's look at the canonical purification of our standard bipartite state:

The cross-section entropy is half the entropy of the AA' system.

Reflected entropy and its properties

## Reflected entropy

#### Definition

For a bipartite state  $\rho_{AB}$ , the *reflected entropy* is

$$S_R(A:B) \equiv S_{\mathsf{vN}}(AA')_{|\psi_{\rho}\rangle}.$$

According to Dutta-Faulkner, we have

$$S_R(A:B) = \frac{\operatorname{area}(\sigma_{A:B})}{2G_N} + \operatorname{quantum corrections}$$

Reflected entropy and its properties

# Some fundamental properties

■ For the quantum info experts in the audience:<sup>1</sup>

$$S_R(A:B)_{\rho}-I(A:B)_{\rho}=I(A:B'|B)_{|\psi_{\rho}\rangle}.$$

This implies

$$S_R(A:B)-I(A:B)\geq 0.$$

We will call  $S_R - I$  the Markov gap.

■ If a holographic state has  $O(1/G_N)$  Markov gap, then it must have  $O(1/G_N)$  multipartite entanglement. [Akers-Rath]

 $^{1}I(A:B) = S(A) + S(B) - S(AB).$

Main result

### Main technical result

For (time-symmetric)  $AdS_3$  states with no matter, we have proven the following inequality:

$$S_R(A:B) - I(A:B) \ge \frac{\log(2)}{2G_N} |\partial \sigma_{A:B}|.$$

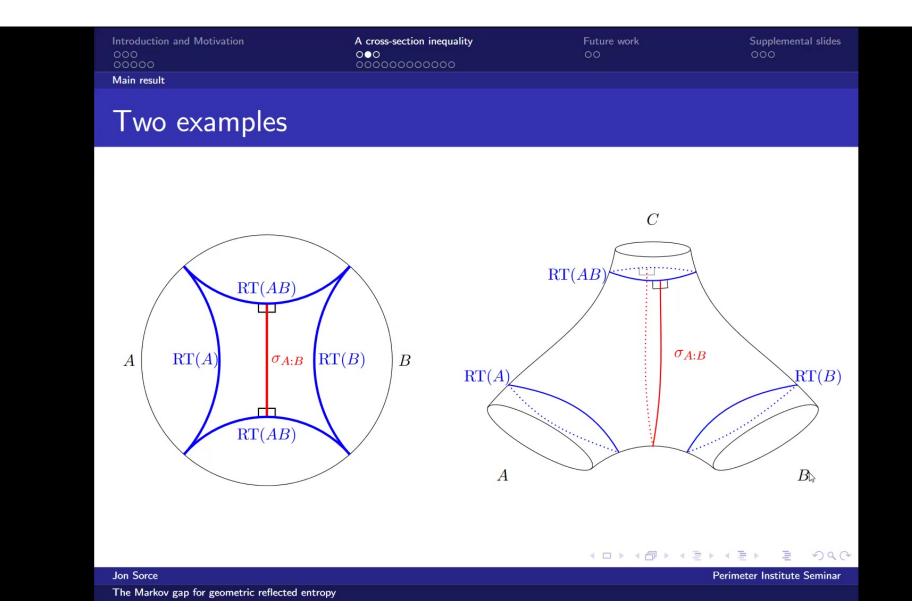

The quantity  $|\partial \sigma_{A:B}|$  is the *cardinality of the cross-section boundary*, i.e., the number of cross-section endpoints.

Pirsa: 21110037 Page 16/33

Main result

## Heuristic interpretation

$$S_R(A:B) - I(A:B) \ge \frac{\log(2)}{2G_N} |\partial \sigma_{A:B}|.$$

- Because  $S_R I$  is  $O(1/G_N)$  only if there is significant tripartite entanglement, this formula suggests that  $\partial \sigma_{A:B}$  emerges from irreducible tripartite entanglement.
- Generalizing this inequality to states with matter, or to higher dimensions, would help us better understand universal tripartite entanglement in quantum gravity.

Pirsa: 21110037 Page 17/33

## RT and KRT surfaces

Let's look at an example two-party state:

The Markov gap can be expressed visually as

Jon Sorce

Perimeter Institute Seminar

The Markov gap for geometric reflected entropy

Pirsa: 21110037 Page 18/33

## Reframing the question

We want to lower-bound the area difference between KRT and RT in terms of the number of kinks in KRT.

#### Question

On a hyperbolic 2-manifold, if KRT is a geodesic with right-angled kinks and RT the minimal homologous geodesic, can we show

$$area(KRT) - area(RT) \ge log(2) \times |kinks|$$
?

Jon Sorce

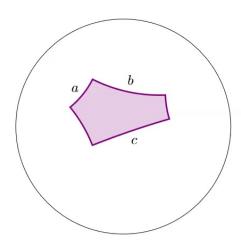

Perimeter Institute Seminar

The Markov gap for geometric reflected entropy

Pirsa: 21110037 Page 19/33

# A simple example using right-angled pentagons

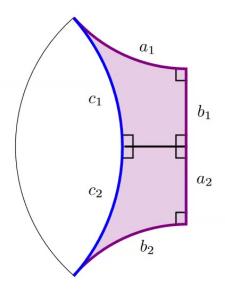

In hyperbolic space, the right-angled pentagon

satisfies

$$a+b-c \ge \log(2)$$
.

Can use these to tile between KRT and RT:

Jon Sorce

Perimeter Institute Seminar

The Markov gap for geometric reflected entropy

Pirsa: 21110037 Page 20/33

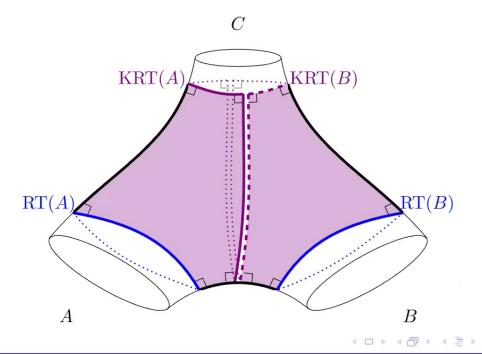

Future work

Supplemental slides

Sketch of proof

## One more example

Generally, our strategy will be to tile the region between RT and KRT with pentagons:

Jon Sorce Perimeter Institute Seminar

The Markov gap for geometric reflected entropy

Pirsa: 21110037 Page 21/33

Future work

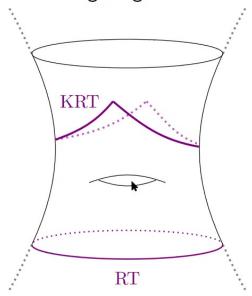

Supplemental slides

Sketch of proof

## **Obstacles**

Two main issues must be addressed:

11 These tilings can't exist for higher-genus manifolds:

Even in the absence of topological obstructions, how do we know these tilings exist?

Jon Sorce

Perimeter Institute Seminar

The Markov gap for geometric reflected entropy

Pirsa: 21110037 Page 22/33

## Strategy

Using covering space theory, we

- **11** Show that KRT is *homotopic* to a smooth geodesic  $\gamma$ .
- 2 Show that the *homotopy* region can be tiled with pentagons.
- 3 Use

$$\gamma \sim_{\mathsf{homology}} \mathsf{KRT}_{\mathbf{k}} \sim_{\mathsf{homology}} \mathsf{RT}$$

to show

$$area(RT) \le area(\gamma) \le area(KRT) - log(2) \times |kinks|$$
.

Jon Sorce Perimeter Institute Seminar

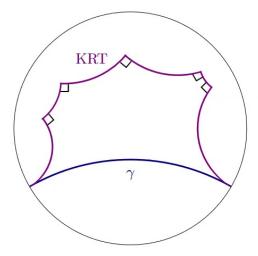

The Markov gap for geometric reflected entropy

Pirsa: 21110037 Page 23/33

### The Poincaré disk

Let KRT be a kinked geodesic on the Poincaré disk with well-defined boundary endpoints:

B

There is a unique geodesic  $\gamma$  between those two endpoints. KRT is homotopic to  $\gamma$ .

Jon Sorce

Perimeter Institute Seminar

The Markov gap for geometric reflected entropy

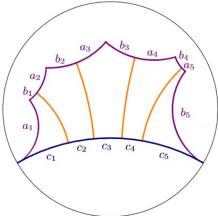

Pirsa: 21110037 Page 24/33

### The Poincaré disk

### Fact

For any two geodesics on the Poincaré disk, there is a *unique* geodesic intersecting them both at right angles.

For each segment of KRT, draw the unique such geodesic connecting it to  $\gamma$ :

Jon Sorce

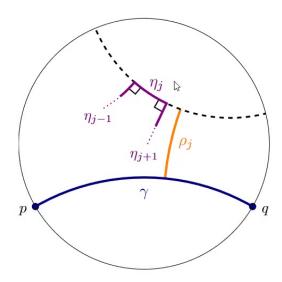

Perimeter Institute Seminar

The Markov gap for geometric reflected entropy

Pirsa: 21110037 Page 25/33

### Existence?

There's an important caveat — the unique geodesic connecting a segment to  $\gamma$  might not lie on the segment itself:

In the paper, we show that this cannot happen unless KRT self-intersects.

The Markov gap for geometric reflected entropy

Pirsa: 21110037 Page 26/33

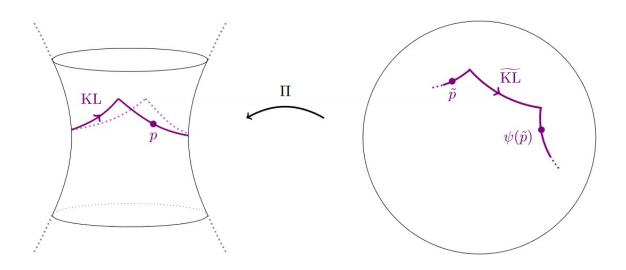

Future work

Supplemental slides

Sketch of proof

## Sketching the extension

To prove the general theorem, we use the fact that every hyperbolic 2-manifold is universally covered by the Poincaré disk:

By tracking lengths between the manifold and the universal cover carefully, we complete the proof.

Jon Sorce Perimeter Institute Seminar

The Markov gap for geometric reflected entropy

Pirsa: 21110037 Page 27/33

### What did we learn?

$$S_R(A:B) - I(A:B) \ge \frac{2\log(2)|\partial \sigma_{A:B}|}{4G_N}.$$

In the proof we used, every point in  $\partial \sigma_{A:B}$  was treated on equal footing. **To each endpoint, we associated two right-angled hyperbolic pentagons.** To each pentagon, we associate a minimal area difference of  $2 \log(2)$ .

The proof technique is aesthetically in line with our guiding principle: that each point in  $\partial \sigma_{A:B}$  contributes some irreducible tripartite entanglement. (Here, in the form of two pentagons.)

Jon Sorce

Perimeter Institute Seminar

The Markov gap for geometric reflected entropy

Pirsa: 21110037 Page 28/33

### Generalizations?

- 11 It would be nice to know if the inequality holds for spacetimes with matter satisfying a suitable energy condition. We'll need a new proof technique to prove it. (Work in progress with Dan Eniceicu.)
- 2 Will some version of this inequality hold in higher dimensions? Two natural generalizations:

$$S_R(A:B) - I(A:B) \ge C_d \times \text{area}(\partial \sigma_{A:B}),$$
  
 $S_R(A:B) - I(A:B) \ge C_d \times \text{components}(\partial \sigma_{A:B}).$ 

Jon Sorce

Perimeter Institute Seminar

The Markov gap for geometric reflected entropy

Pirsa: 21110037 Page 29/33

## A quantum of tripartite entanglement?

 $AdS_3$  gravity has central charge  $c = 3/2G_N$ . So we may rewrite our inequality as

$$S_R(A:B) - I(A:B) \ge \frac{c}{3} \log(2) |\partial \sigma_{A:B}|.$$

This bound is not satisfied in generic CFTs, but numerics show that the limiting behavior seems universal. Where does  $c \log(2)/3$  come from in 2D CFT? (Independent work in progress, and work in progress with Yijian Zou.)

## Markov recovery

Introduction and Motivation

000

Recall:

$$S_R(A:B)_{\rho} - I(A:B)_{\rho} = I(A:B'|B)_{|\psi_{\rho}\rangle}.$$

■ This implies [Fawzi-Renner, ..., Junge-Renner-Sutter-Wilde-Winter]

$$S_R - I \ge -\max_{\mathcal{R}_{A \to AA'}} \log F(\rho_{ABB'}, \mathcal{R}_{B \to BB'}(\rho_{AB})).$$

Interpret the Markov gap as an obstruction to producing  $\rho_{ABB'}$  from  $\rho_{AB}$  without touching the A system.
