

Title: Solar Neutrinos: from background to signal

Speakers: Tien-Tien Yu

Series: Particle Physics

Date: March 08, 2022 - 1:00 PM

URL: <https://pirsa.org/22030020>

Abstract: Solar neutrinos are an inevitable background to any dark matter direct detection experiment as they closely mimic the signature of dark matter. In this talk, I will discuss the effects of solar neutrinos on the reach of dark matter-electron scattering experiments, with a focus on semiconductor and xenon-based detectors. In addition, I will present the prospects of measuring and understanding the various solar neutrino components using the same detectors, as well as the effects of non-standard neutrino interactions, thus turning solar neutrinos from a background to an interesting signal in their own right.

take-away

- solar neutrinos are only an important background for DM-e scattering in semiconductors for exposures above 1 kg-year
- they are already important for xenon at 100 g-years
- they are important for absorption at ~ 1 kg-year in both semiconductors and xenon

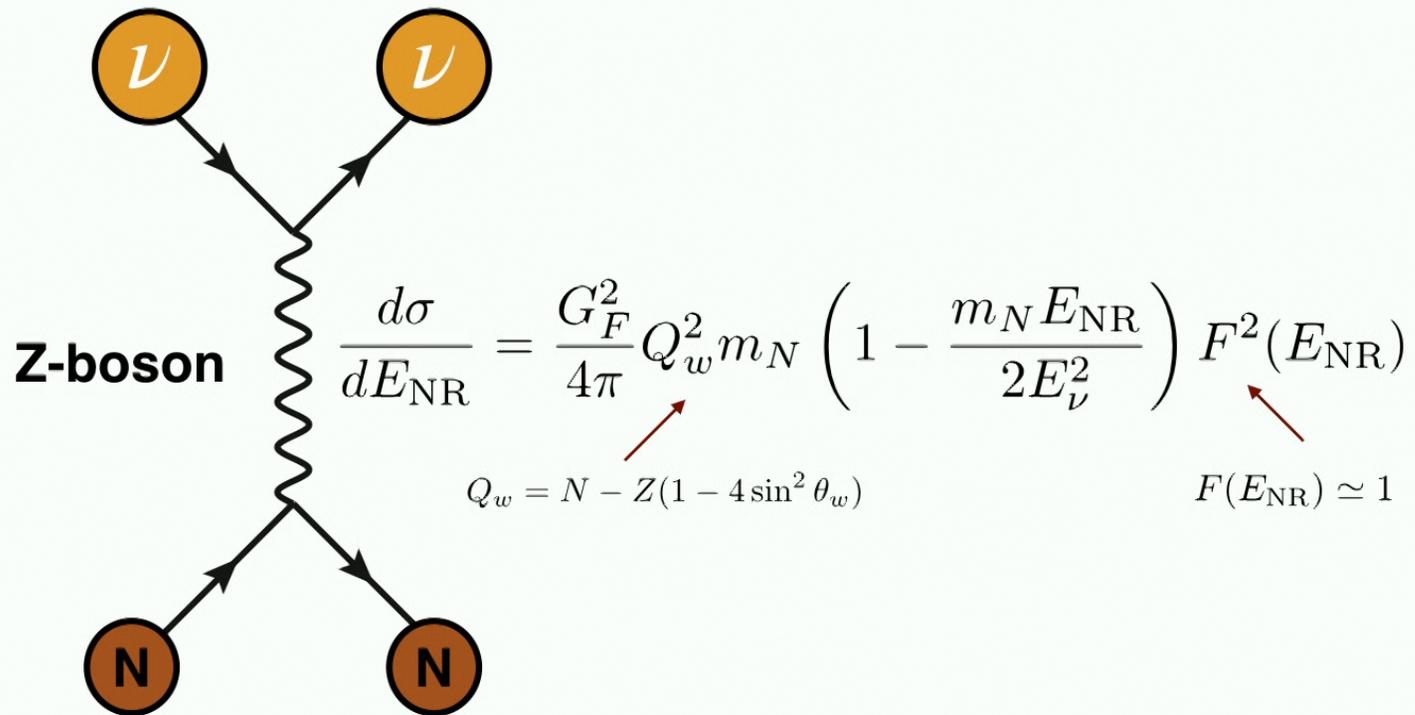

Act II: neutrinos as signal

why is direct detection (potentially) interesting?

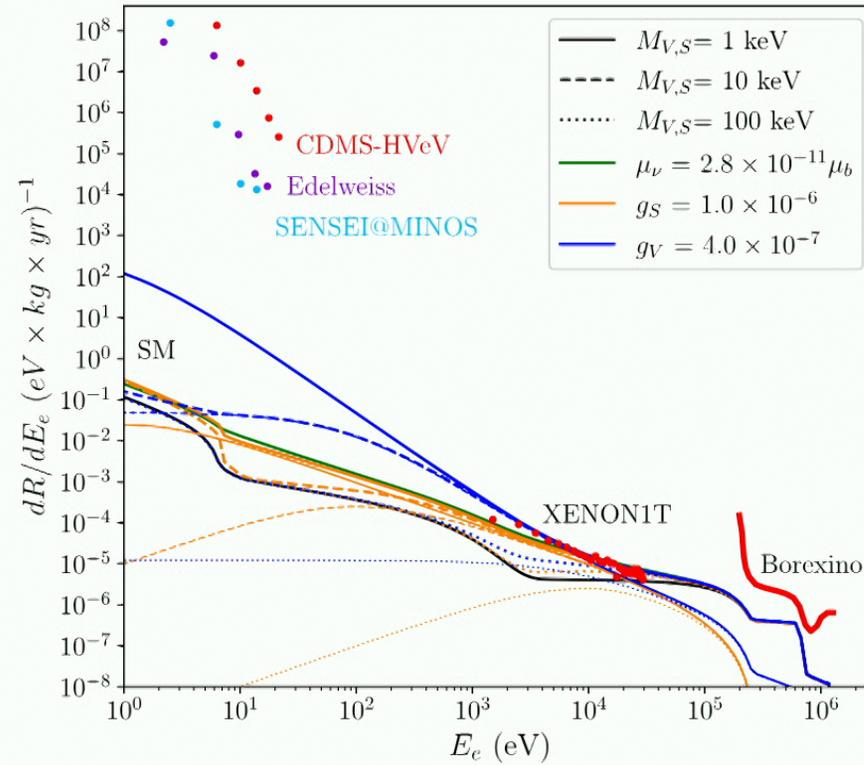

- measure pure neutral current ^8B spectrum for the first time
- allows for first direct measurement of neutrino survival probability in “transition region”
- could probe lower energies than existing SNO measurements
- measure survival probability in “vacuum” region
- help understanding of “solar abundance problem”
- non-standard interactions
