Abstract: Virtual

Ana Inés Ennis

PhD at Instituto de Astrofísica de La Plata - Universidad Nacional de La Plata

My main topic of research is the **evolutionary history of early-type galaxies**, with a specific focus on discrete tracers such as **globular clusters** and **planetary nebulae**. I am interested in studying the **influence of the density of the environment** on the evolution of galaxies.

I work with multiwavelength observations, using both photometry and spectroscopy, mostly studying individual galaxies.

I will start as a joint fellow between Waterloo Centre for Astrophysics and Perimeter Institute in November.

During this period, I would like to broaden my scope and study galaxy evolution at higher redshifts, becoming involved in surveys. I am interested in learning new observational techniques, and expanding my data analysis skills.
