Jet Cluster

DM is very very weakly interacting with DM & SM.

gas

$$\sigma \sim \frac{\alpha_2^2}{m_\chi^2}$$

$g \sim 10^{23} \text{ GeV}$
fm (50 MeV)

$$\frac{\sigma}{m_\chi} \lesssim 1 \text{ cm}^2/\text{g}$$

$$\frac{\sigma}{m_\chi} = \frac{(0.1)^2}{1 \text{ eV}^3}$$

Gas A & B

Galaxy A stars

DM A

DM is very very weakly interacting with DM & SM.

gas

$$\sigma \sim \frac{\alpha^2}{m_\chi^2}$$

$$g \sim 10^{23} \text{ GeV}$$

$$f_m \frac{100 \text{ MeV} = 1}$$

$$\frac{\sigma}{m_\chi} \lesssim 1 \text{ cm}^2/\text{g}$$

$$\frac{\sigma}{m_\chi} = \frac{(0.1)^2}{1 \text{ eV}^3} \sim \frac{f_m}{(10^4)^2 10^3 \text{ GeV}}$$

$$\sim \frac{10^8 \cdot 10^{-20} \text{ g}}{(10^{13} \text{ cm})^2}$$

$$\sim 10^{-14} \text{ cm}^2/\text{g}$$

DM is very very weakly interacting with DM & SM.

gas

$$\sigma \sim \frac{\alpha^2}{m_\chi^2}$$

$$g \sim 10^{23} \text{ GeV} \cdot \text{fm} \cdot \frac{100 \text{ MeV}}{1}$$

Galaxy A star

$$\frac{\sigma}{m_\chi} \lesssim 1 \text{ cm}^2/\text{g}$$

DM A

$$\frac{\alpha^2}{m_\chi^3} = \frac{\sigma}{m_\chi} = \frac{(0.1)^2}{1 \text{ eV}^3} \sim \frac{\text{fm}^2}{(10^4)^2 \cdot 10^3 \text{ GeV}} \sim \frac{10^{-13} \text{ cm}^2}{10^8 \cdot 10^{-20} \text{ g}} \sim 10^{-14} \text{ cm}^2/\text{g}$$

Direct Detection:

CDMS & Xenon

Signal:

$$m_\chi > \frac{m_{SM}}{10^3} \begin{cases} X_e & \sim 100 \text{ GeV} \\ S_i & \sim 10 \text{ GeV} \end{cases}$$

Imagine DM χ , I see it every time it scatters.

$$N_{\text{scattering}} = \Gamma t = n v \cdot \sigma t = C$$

$$\Rightarrow \frac{\sigma}{m_\chi} = C$$

$$= \frac{P_{DM}}{m_\chi} \cdot \frac{1}{v} \cdot t = C$$

Light DM

$$P_{SM} = \frac{m_{DM} \cdot v_{DM}}{m_{SM}}$$

$$E \sim \frac{m_{DM}^2}{m_{SM}} \cdot v_{DM}^2 \sim \frac{1 \text{ GeV}^2}{100 \text{ GeV}} \cdot 10^{-6} \approx 10 \text{ eV}$$

If I want smaller DM mass sensitivity:

Si (QMS)

$$E \sim 100 \text{ eV} \left(\frac{m_{DM}}{1 \text{ GeV}} \right)^2$$

Electron Recoil:

$m_e \sim 0.5 \text{ MeV}$

SENSEI experiment

$m_X \gg 1 \text{ MeV}$

$$E \sim m_e \cdot v_{DM}^2 = 0 \text{ V}$$

Blog:

Why Xenon?

Signal: Heavy, $m \sim 100 \text{ GeV}$. $M_{\text{X}} > 100 \text{ GeV}$, it
picks up most energy

1. What can mimic a signal?

Radioactivity. we stop at Xenon
Gap

2. Why not metal?

$$\frac{10 \text{ keV}}{1} \sim \frac{10^{-16} \text{ J}}{1 \text{ GeV}}$$

Thermal Noise

Pb

In
S

(P6)

Indirect detection.

Signal.

Annihilation

Decay

$$\frac{P}{V} = n_{DM}^2 \cdot \sigma = \rho_{DM}^2 \cdot \frac{G}{m}$$

$$\frac{P}{V} = n_{DM}^2 \cdot \sigma = \rho_{DM} \cdot \frac{G}{m^2} \cdot \frac{dE}{dV dt} \propto \rho_{DM}^2 \left[\frac{G}{m} \right]$$

$$\frac{P}{V} = n_{DM} \cdot \Gamma \quad \frac{dE}{dV dt} \propto \rho_{DM} \cdot \Gamma_{DM}$$

When indirect detection.

Blg.

Lab vs Galaxy

Signal

$$P \sim V_{det}$$

$$\text{Volume} \propto d^3$$

$$\text{Fraction} \propto \frac{A}{d^2}$$

$$V.F \sim \frac{d}{R_{det}}$$

Solid angle

$$\frac{1 \text{ sr}}{10 \text{ m}} \sim 10^{-20}$$

Bkg: { Galaxy center signal is largest. Bkg is large.

{ Dwarf Galaxies Limit setting. Clean.

$$\text{cm} \cdot \text{TeV} = \text{cm} \cdot 10^4 \cdot \frac{1}{\text{fm}} \approx 10^7$$

$$\frac{n_B}{n_\gamma} \sim 10^{-10}$$

$$\frac{N_{DM} \cdot G}{H} \sim 1$$

$$\frac{\text{GeV}/\text{cm}^3 \cdot \frac{1}{\text{TeV}^2} \cdot \frac{1}{\text{TeV}} \cdot 10^{-3}}{H}$$

$$\boxed{10^{-22}/\text{yr}}$$

$$\approx \frac{eN \cdot 10^9 \cdot 10^{-3} \cdot 10^6}{(10^{17})^3 \cdot 10^{-33} \cdot eN \cdot 10^{18}} \approx 10^{-12}$$
