Abstract: Certifying that an n-qubit state synthesized in the lab is close to the target state is a fundamental task in quantum information science. However, existing rigorous protocols either require deep quantum circuits or exponentially many single-qubit measurements. In this work, we prove that almost all n-qubit target states, including those with exponential circuit complexity, can be certified from only  $O(n^2)$  single-qubit measurements. This result is established by a new technique that relates certification to the mixing time of a random walk. Our protocol has applications for benchmarking quantum systems, for optimizing quantum circuits to generate a desired target state, and for learning and verifying neural networks, tensor networks, and various other representations of quantum states using only single-qubit measurements. We show that such verified representations can be used to efficiently predict highly non-local properties that would otherwise require an exponential number of measurements. We demonstrate these applications in numerical experiments with up to 120 qubits, and observe advantage over existing methods such as cross-entropy benchmarking (XEB).

with John Preskill and Mehdi Soleimanifar

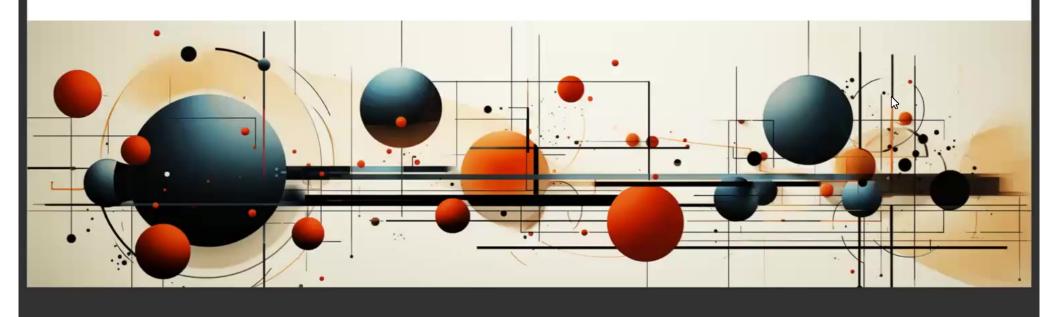

Pirsa: 24050036 Page 2/47

#### Motivation

 Quantum systems with intricate entanglement are pivotal in quantum information science.

Pirsa: 24050036 Page 3/47

#### Motivation

- Quantum systems with intricate entanglement are pivotal in quantum information science.
- To understand if we have created the desired quantum system in the lab, we need to perform certification.

Pirsa: 24050036 Page 4/47

#### What is Certification?

- We have a desired n-qubit state  $|\psi\rangle$ , which is our target state.
- We have an n-qubit state  $\rho$  created in the experimental lab.
- Task: Test if  $\rho$  is close to  $|\psi\rangle\langle\psi|$  or not from data?  $(\langle\psi|\rho|\psi\rangle)$  is close to 1)
- A fundamental task in data science for quantum.

Pirsa: 24050036 Page 5/47

#### Motivation

 Many techniques based on statistics & learning theory have been proposed for performing certification.

 However, it remains experimentally challenging to certify highlyentangled quantum many-body systems.

Pirsa: 24050036

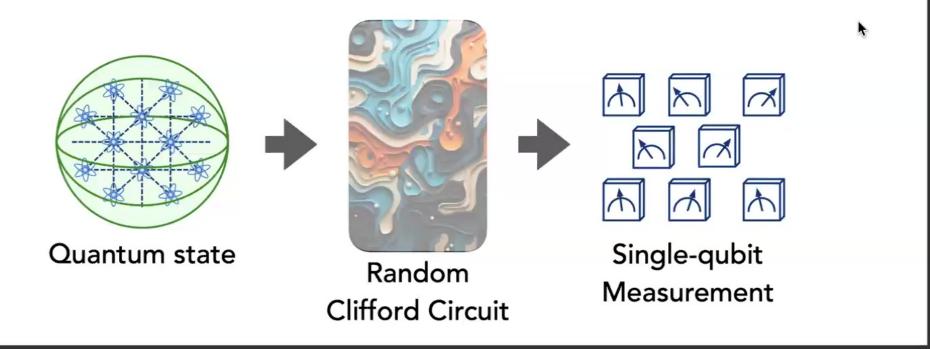

#### What is Certification?

- We have a desired *n*-qubit state  $|\psi\rangle$ , which is our target state.
- ullet We have an n-qubit state ho created in the experimental lab.
- Task: Test if  $\rho$  is close to  $|\psi\rangle\langle\psi|$  or not from data?  $(\langle\psi|\rho|\psi\rangle)$  is close to 1)
- A fundamental task in data science for quantum.

Pirsa: 24050036 Page 7/47

• Approach 1: Random Clifford measurements (classical shadow)

Pirsa: 24050036 Page 8/47

- Approach 1: Random Clifford measurements (classical shadow)
- Advantage:

Only needs **depth**-n random Clifford circuits on  $\rho$ 

Challenge:

Implementing depth-n random Clifford circuits is still experimentally challenging.

Pirsa: 24050036 Page 9/47

- Approach 2: Random Pauli measurements (classical shadow)
- Advantage:

Only needs single-qubit measurements on  $\rho$ 

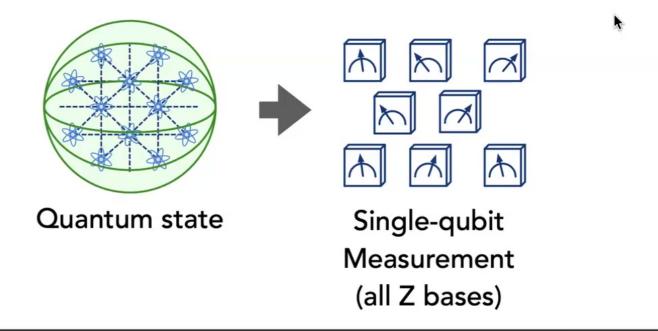

#### Challenge:

Requires  $\exp(n)$  measurements for most target  $|\psi\rangle$  especially when  $|\psi\rangle$  is highly entangled.

Pirsa: 24050036 Page 10/47

Approach 3: Cross-entropy benchmark (XEB)

Pirsa: 24050036 Page 11/47

- Approach 3: Cross-entropy benchmark (XEB)
- Advantage:

Only needs single-qubit measurements (Z-basis) on  $\rho$ 

Challenge:

Does not rigorously address the certification task.

 $\rho$  can be far from  $|\psi\rangle\langle\psi|$  despite perfect XEB score.

Pirsa: 24050036 Page 12/47

# **Existing Challenges**

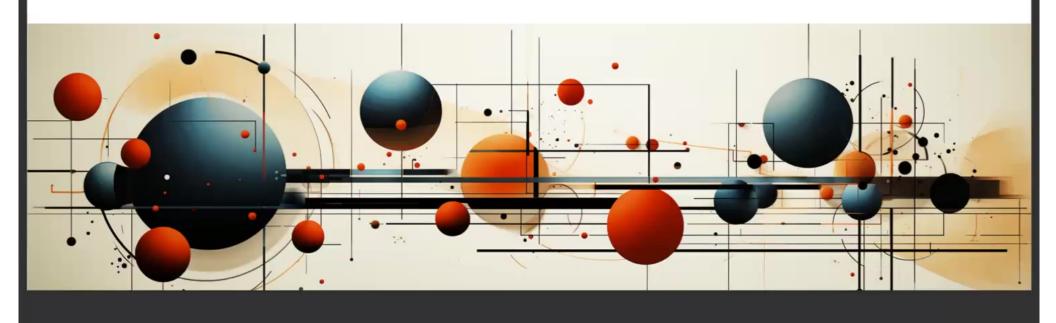

- All existing certification protocols either
  - a. Require deep quantum circuits before measurements
  - b. Use exponentially many measurements
  - c. Apply only for low-entanglement state  $|\psi\rangle$
  - d. Lack rigorous guarantees

Pirsa: 24050036 Page 13/47

#### Question

Can we rigorously certify almost all quantum states from performing few single-qubit measurements?

Pirsa: 24050036 Page 14/47

### **Outline**

- Theorem
- Protocol
- Applications

Pirsa: 24050036 Page 15/47

#### Certification

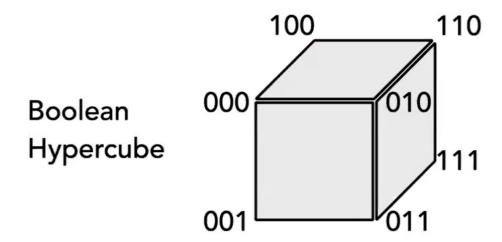

#### Theorem 1

For almost all n-qubit state  $|\psi\rangle$ , we can certify that  $\rho$  is close to  $|\psi\rangle\langle\psi|$  using only  $\mathcal{O}(n^2)$  single-qubit measurements.

- The certification procedure applies to any  $\rho$ .
- $\mathcal{O}(n^2)$  is enough even when  $|\psi\rangle$  has  $\exp(n)$  circuit complexity.

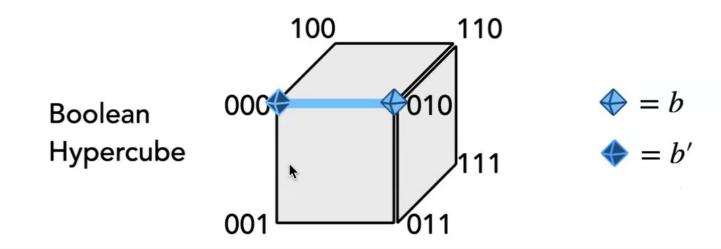

Pirsa: 24050036 Page 16/47

- Consider an *n*-qubit target state  $|\psi\rangle$ .
- $\bullet$  Choose a basis  $|b\rangle$ , where  $b \in \{0,1\}^n$  is a bitstring.
- Let  $\pi(b) = |\langle b|\psi\rangle|^2$  be the measurement distribution.

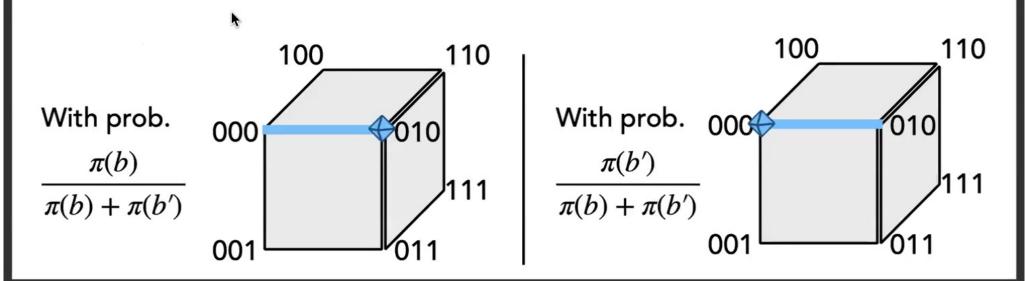

Pirsa: 24050036 Page 17/47

- Let  $\pi(b) = |\langle b|\psi\rangle|^2$  be the measurement distribution.
- $\bullet$  Consider a random walk on n-bit Boolean hypercube.

Pirsa: 24050036

- Let  $\pi(b) = |\langle b|\psi\rangle|^2$  be the measurement distribution.
- Let  $\tau$  be the time the random talk takes to relax to stationary  $\pi$ .

### **Outline**

- Theorem
- Protocol
- Applications

#### **Measurement Protocol**

ullet Pick a random qubit x. Measure x in random X/Y/Z basis.

Pirsa: 24050036 Page 21/47

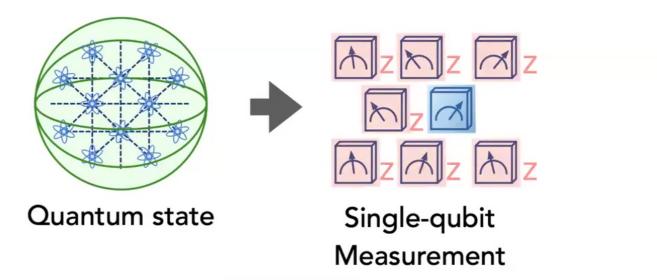

- Consider an *n*-qubit target state  $|\psi\rangle$ .
- Choose a basis  $|b\rangle$ , where  $b \in \{0,1\}^n$  is a bitstring.
- Let  $\pi(b) = |\langle b|\psi\rangle|^2$  be the measurement distribution.

Pirsa: 24050036 Page 22/47

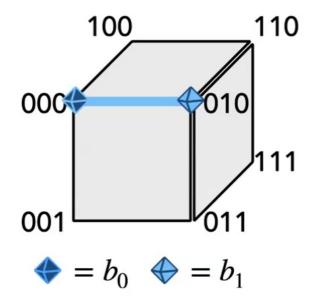

#### **Measurement Protocol**

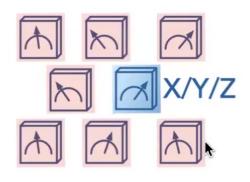

ullet Pick a random qubit x. Measure all except qubit x in Z basis.

Pirsa: 24050036 Page 23/47

lacktriangle The measurement outcomes on  $\begin{tabular}{l} \line \$ 

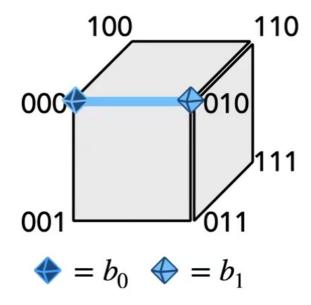

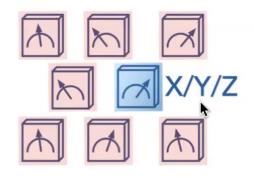

Single-qubit Measurement

Pirsa: 24050036 Page 24/47

• The ideal post-measurement 1-qubit state  $|\psi_{b_0,b_1}\rangle$  on qubit x is proportional to  $\langle b_0|\psi\rangle|0\rangle+\langle b_1|\psi\rangle|1\rangle$ .

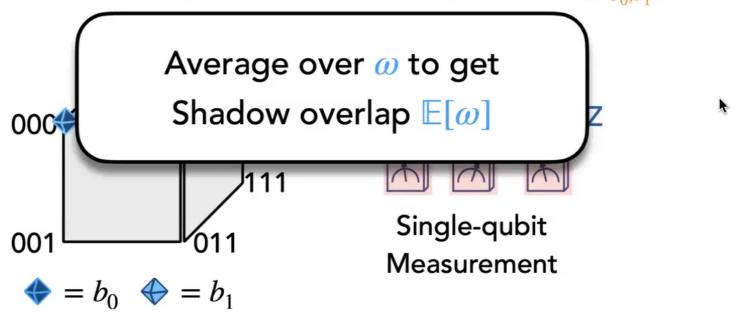

Single-qubit Measurement

Pirsa: 24050036 Page 25/47

• Use randomized Pauli measurement (classical shadow) on qubit x to predict the fidelity  $\omega$  with the ideal 1-qubit state  $|\psi_{b_0,b_1}\rangle$ .

Pirsa: 24050036 Page 26/47

### **Key Feature**

Shadow overlap  $\mathbb{E}[\omega]$  accurately tracks the fidelity  $\langle \psi | \rho | \psi \rangle$ .

$$\mathbb{E}[\omega] \ge 1 - \epsilon \text{ implies } \langle \psi | \rho | \psi \rangle \ge 1 - \tau \epsilon$$

$$\langle \psi | \rho | \psi \rangle \ge 1 - \epsilon \text{ implies } \mathbb{E}[\omega] \ge 1 - \epsilon$$

au is the time the random talk takes to relax to stationary  $\pi$ 

Pirsa: 24050036 Page 27/47

### **Physical Intuition**

Shadow overlap 
$$\mathbb{E}[\omega] = \frac{1}{n} \sum_{i=1}^{n} \sum_{b_{\neq i} \in \{0,1\}^{n-1}} \operatorname{Tr}\left(\langle b_{\neq i} | \rho | b_{\neq i} \rangle \frac{\langle b_{\neq i} | \psi \rangle \langle \psi | b_{\neq i} \rangle}{\operatorname{Tr}\langle b_{\neq i} | \psi \rangle \langle \psi | b_{\neq i} \rangle}\right)$$

 $\bullet$  | + ... +  $\times$  + ... + | and | - ... -  $\times$  - ... - | has fidelity 0.

 $\bullet$   $|+...+\delta+...+|$  and  $|-...-\delta-...-|$  has  $\mathbb{E}[\omega]=0$ .

Pirsa: 24050036 Page 28/47

## **Physical Intuition**

Shadow overlap 
$$\mathbb{E}[\omega] = \frac{1}{n} \sum_{i=1}^{n} \sum_{b_{\neq i} \in \{0,1\}^{n-1}} \operatorname{Tr}\left(\langle b_{\neq i} | \rho | b_{\neq i} \rangle \frac{\langle b_{\neq i} | \psi \rangle \langle \psi | b_{\neq i} \rangle}{\operatorname{Tr}\langle b_{\neq i} | \psi \rangle \langle \psi | b_{\neq i} \rangle}\right)$$

$$\bullet$$
  $|+...+\delta+...+|$  and  $|+...+-\delta+...+-|$  has fidelity 0.

$$\bullet$$
  $|+...+\delta+...+|$  and  $|+...+-\delta+...+-|$  has  $\mathbb{E}[\omega]=\frac{n-1}{n}$ .

Pirsa: 24050036 Page 29/47

## **Physical Intuition**

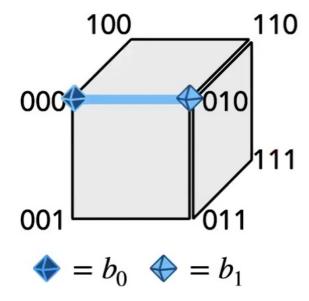

Shadow overlap 
$$\mathbb{E}[\omega] = \frac{1}{n} \sum_{i=1}^{n} \sum_{b_{\neq i} \in \{0,1\}^{n-1}} \operatorname{Tr}\left(\langle b_{\neq i} | \rho | b_{\neq i} \rangle \frac{\langle b_{\neq i} | \psi \rangle \langle \psi | b_{\neq i} \rangle}{\operatorname{Tr}\langle b_{\neq i} | \psi \rangle \langle \psi | b_{\neq i} \rangle}\right)$$

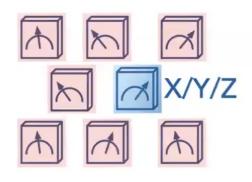

- $\bullet$  | + ... +  $\times$  + ... + | and | + ... +  $\times$  + ... + | has fidelity 0.
- $\bullet$   $|+...+\delta+...+|$  and  $|+...+-\delta+...+-|$  has  $\mathbb{E}[\omega]=\frac{n-1}{n}$ .

• Shadow overlap has a Hamming distance nature.

Pirsa: 24050036 Page 30/47

• The ideal post-measurement 1-qubit state  $|\psi_{b_0,b_1}\rangle$  on qubit x is proportional to  $\langle b_0|\psi\rangle|0\rangle+\langle b_1|\psi\rangle|1\rangle$ .

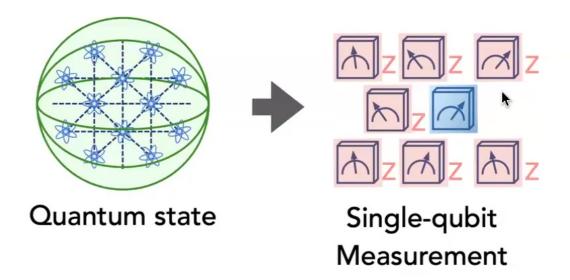

Single-qubit Measurement

Pirsa: 24050036 Page 31/47

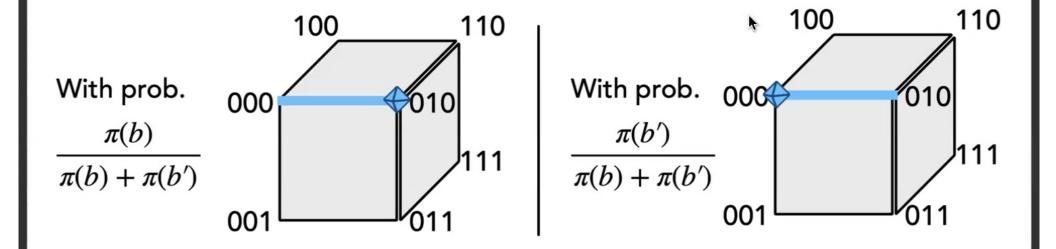

#### Measurement Protocol

ullet Pick a random qubit x. Measure all except qubit x in Z basis.

Pirsa: 24050036 Page 32/47

- Let  $\pi(b) = |\langle b|\psi\rangle|^2$  be the measurement distribution.
- Let  $\tau$  be the time the random talk takes to relax to stationary  $\pi$ .

Pirsa: 24050036

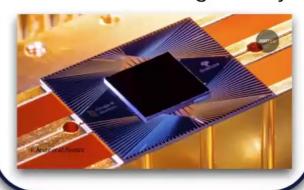

# **Applications**

What can we use this new certification protocol for?

#### Example 1

Benchmarking

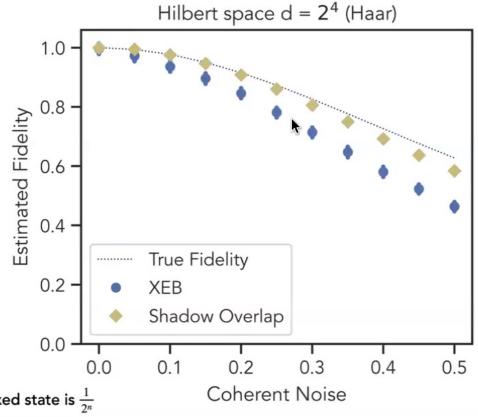

Shadow overlap  $\mathbb{E}[\omega]$  certifies if the state has a high fidelity

Pirsa: 24050036 Page 34/47

4-qubit Haar random state

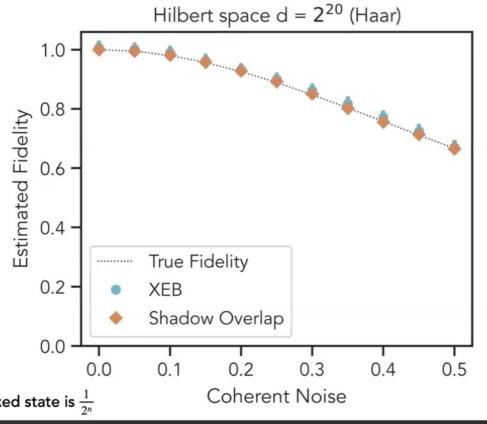

Coherent Noise

\*Shadow overlap normalized s.t., target state is 1, maximally mixed state is  $\frac{1}{2^n}$ 

Pirsa: 24050036 Page 35/47

20-qubit Haar random state Coherent Noise

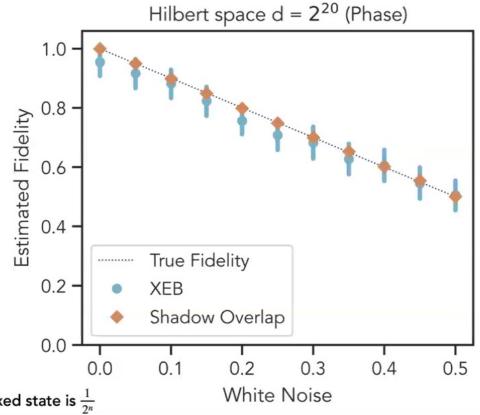

\*Shadow overlap normalized s.t., target state is 1, maximally mixed state is  $\frac{1}{2^n}$ 

Pirsa: 24050036 Page 36/47

20-qubit random structured state White Noise

$$|\psi\rangle = U_{\text{phase}} \bigotimes_{i=1}^{20} |\psi_i\rangle$$

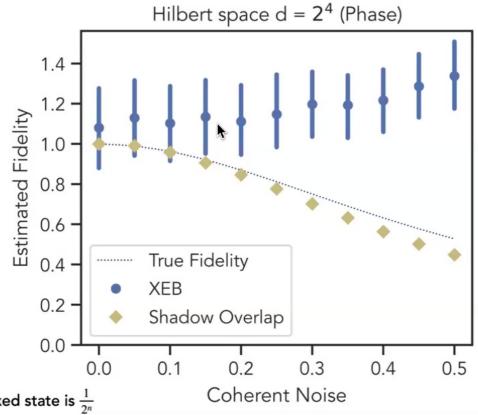

\*Shadow overlap normalized s.t., target state is 1, maximally mixed state is  $\frac{1}{2^n}$ 

Pirsa: 24050036 Page 37/47

4-qubit random structured state

Coherent Noise

$$|\psi\rangle = U_{\text{phase}} \bigotimes_{i=1}^{4} |\psi_i\rangle$$

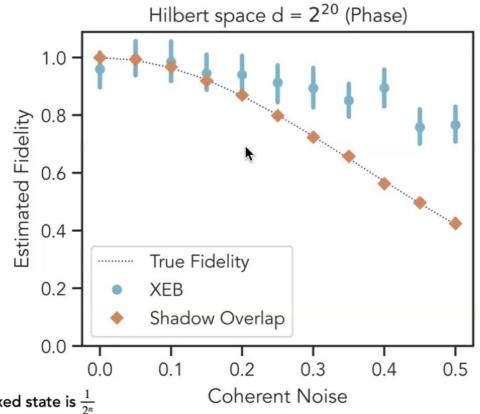

\*Shadow overlap normalized s.t., target state is 1, maximally mixed state is  $\frac{1}{2^n}$ 

Pirsa: 24050036 Page 38/47

20-qubit random structured state

Coherent Noise

$$|\psi\rangle = U_{\text{phase}} \bigotimes_{i=1}^{20} |\psi_i\rangle$$

\*Shadow overlap normalized s.t., target state is 1, maximally mixed state is  $\frac{1}{2^n}$ 

Pirsa: 24050036 Page 39/47

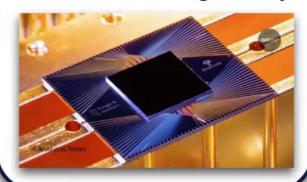

# **Applications**

What can we use this new certification protocol for?

#### Example 1

Benchmarking

Shadow overlap  $\mathbb{E}[\omega]$  certifies if the state has a high fidelity

#### Example 2

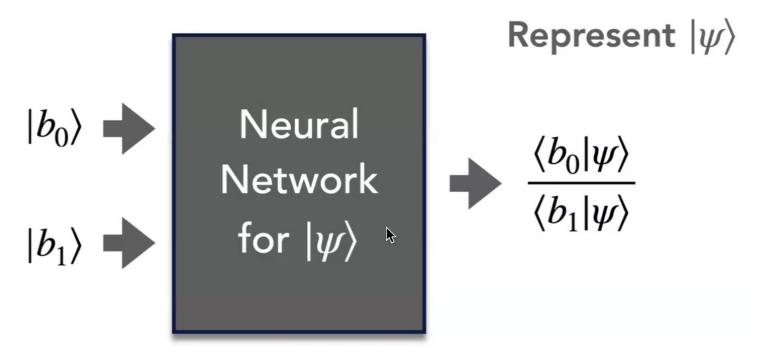

ML tomography

Train/certify ML models, such as neural quantum states, using shadow overlap  $\mathbb{E}[\omega]$ 

Pirsa: 24050036

# Training/Certifying NN tomography

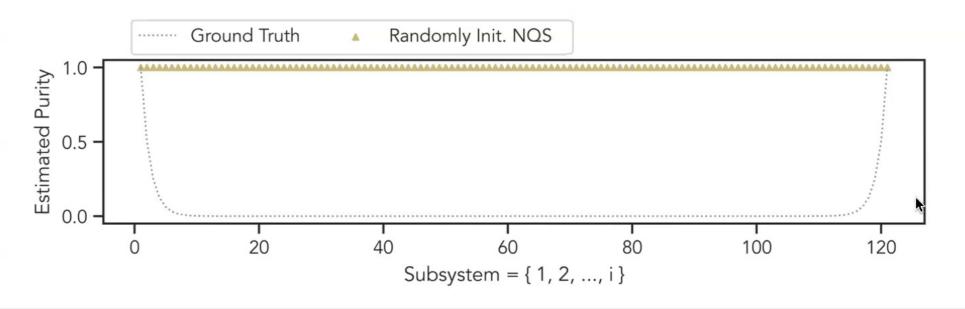

Relative Neural Quantum State

Pirsa: 24050036 Page 41/47

# Training/Certifying NN tomography

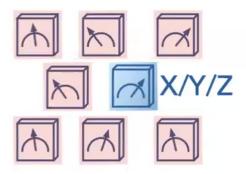

We consider learning a class of 120-qubit states with exponentially high circuit complexity.

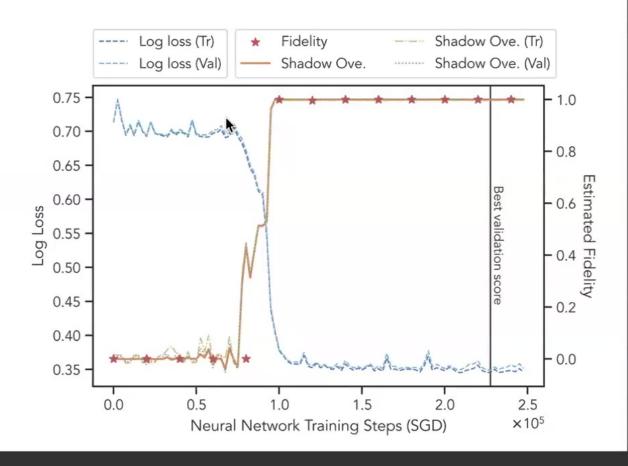

Pirsa: 24050036 Page 42/47

# Training/Certifying NN tomography

Trained using shadow-overlap-based loss

Certified using shadow overlap

Pirsa: 24050036 Page 43/47

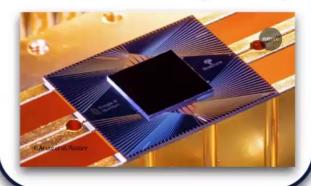

# **Applications**

What can we use this new certification protocol for?

#### Example 1

#### Benchmarking

Shadow overlap  $\mathbb{E}[\omega]$  certifies if the state has a high fidelity

#### Example 2

#### ML tomography

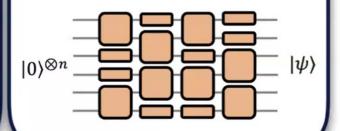

Train/certify ML models, such as neural quantum states, using shadow overlap  $\mathbb{E}[\omega]$ 

#### Example 3

#### Optimizing circuits

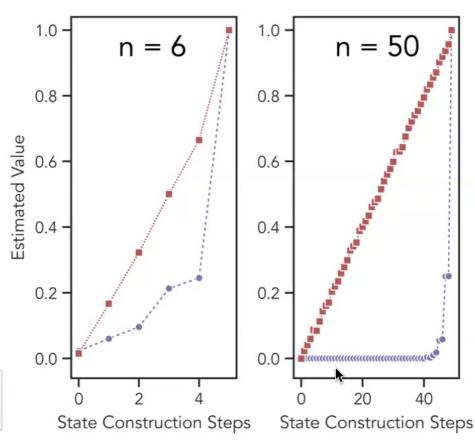

To prepare a target state  $|\psi\rangle$ , we can optimize the circuit to max shadow overlap  $\mathbb{E}[\omega]$ 

# Optimizing state-preparation circuit

Constructing an n-qubit MPS with H, CZ, T gates.

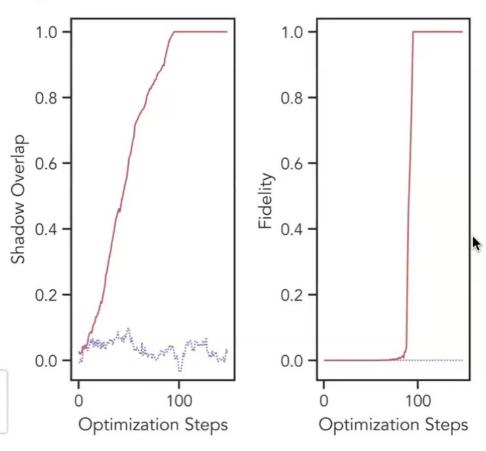

Pirsa: 24050036 Page 45/47

# Optimizing state-preparation circuit

Training using Monte-Carlo optimization to prepare a 50-qubit MPS.

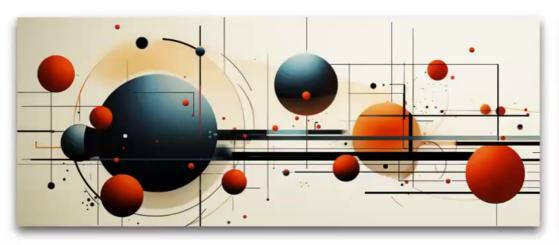

Trained w/ fidelityTrained w/ shadow ove.

Pirsa: 24050036 Page 46/47

#### Conclusion

- We prove that almost all quantum states can be efficiently certified from few single-qubit measurements.
- Are there states not certifiable with few single-qubit measurements?

Pirsa: 24050036 Page 47/47
