Title: Lecture - Beautiful Papers

Speakers: Pedro Vieira

Collection/Series: Beautiful Papers - October 7, 2024 - January 31, 2025

Subject: Other

Date: November 25, 2024 - 9:15 AM

URL: https://pirsa.org/24110036

Plan for the talk:

(I) Some reasons why it is hard :(to find de Sitter vacuum in string theory

(II) Overview of the KKLT construction

(III) Stability of the solution, relation to

GRAVITATIONAL EFFECTS ON AND OF VACUUM DECAY*

Sidney Coleman†
Stanford Linear Accelerator Center
Stanford University, Stanford, California 94305

and

Frank De Luccia
Institute for Advanced Study
Princeton, New Jersey 08540

(IV) People still talk about it! Controversies and relation to The Swampland Program

2/9

(I) Some reasons why it is hard :c to find de Sitter vacuum in string theory

- No-go theorem by [Maldacena, Nuñez ; '00]

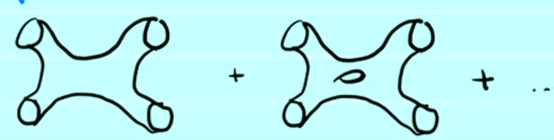
> In the second part of this paper, which can be read independently of the first, we show that there are no non-singular Randall-Sundrum or de-Sitter compactifications for large class of gravity theories.

  - without sources
  - without α' or g_s corrections

α' ← stringy corrections

g_s ← quantum corrections

vs •



3/9

(I) Some reasons why it is hard :c to find de Sitter vacuum in string theory compactifications

- Moduli stabilization

10d spacetime =  ≃ CY_3 × M_{4d} ← where we live

moduli ≡ massless fields characterizing CY_3

- shape
- size

...

4/9

- Scale separation

II Overview of the KKLT construction

Two steps:

(1) Stabilize all moduli in a supersymmetric way

1.1 Fix all moduli except for volume with fluxes

1.2 Fix the volume with quantum corrections

AdS vacua with exponentially large warping

(2) Break supersymmetry and get a de Sitter vacuum ↳ introducing $\overline{D3}$

5/9

III Stability of the solution

The de Sitter vacua is metastable so following Coleman, De Luccia they argue

1) Do our dS vacua survive for a large number of Planck times? For instance, if we fine tune to get a small cosmological constant, is the dS vacuum sufficiently stable to survive during the 10^{10} years of the cosmological evolution? If the answer is positive, one can use the dS minimum for the phenomenological description of the current stage of acceleration (late-time inflation) of the universe.

2) Is the typical decay time of the dS vacuum longer or shorter than the recurrence time $t_r \sim e^{\mathbf{S_0}}$, where $\mathbf{S_0} = \frac{24\pi^2}{V_0}$ is the dS entropy [43]? If the decay time is longer than $t_r \sim e^{\mathbf{S_0}}$, one may need to address the issues about the consistency of the stringy description of dS space raised in [2, 5, 8].

to these questions

6/9

① Thin wall approximation

$$P \approx \exp\left(-\mathbf{S}(\varphi_0)\right) = \exp\left(-\frac{24\pi^2}{V_0}\right) \sim \exp\left(-10^{122}\right) \ .$$

$$t_{\rm decay}^{\rm CDL} \sim t_r \exp\left(-\frac{64\pi^2}{T^2}\right)$$

② No wall approximation

$$t_{\rm decay}^{\rm HM} = e^{-\mathbf{S_1}+\mathbf{S_0}} = t_r \ \exp\left(-\frac{24\pi^2}{V_1}\right) \ll t_r \ .$$

IV Criticisms to KKLT

- Does the $\overline{D3}$ mechanism really work?

  singularities, backreaction, stability ...

- Moduli stabilization

  separation of scales $\uparrow m_\tau, m_\varphi$ ⇝ can you justify the hierarchy?

- are the α' and g_s corrections really controlled?

  Dine-Seiberg problem

  ⊕ non susy ⇝ instability concerns

- Explicit construction with consistent uplift to 10d string theory?

8 / 9

IV The de Sitter conjecture and the Swampland program

Conjecture 9: de Sitter Conjecture

A scalar potential of an EFT weakly coupled to Einstein gravity must satisfy

$$M_P \frac{|\nabla V|}{V} \geq c \,, \tag{9.1}$$

with c some $\mathcal{O}(1)$ constant. This was further refined by stating that the previous bound only needs to be imposed if the following condition on the second derivative of the potential is violated,

$$\min\left(\nabla_i \nabla_j V\right) \leq \frac{-c' V}{M_P^2} \,, \tag{9.2}$$

with c' another $\mathcal{O}(1)$ constant. This way, only dS minima (and not critical points in general) are ruled out.

No proof for this conjecture but people believe no de Sitter solution has been well formulated yet.

9/9

ongoing research program

1.2 Fix the volume with quantum corrections

They give examples of non-perturbative quantum corrections $\sim e^{i\rho}$

a) Euclidean D3 branes [Witten; '96]

b) Gluino condensation,
non-abelian gauge theories living on geometric singularities on X_{CY_3}

$$V_{AdS}^{min} = (-3e^{K} W^2)_{AdS}$$

all moduli stabilized while preserving susy
