Title: Entanglement Hamiltonian and Heun operator

Speakers: Pierre-Antoine Bernard

Collection/Series: Mathematical Physics

Subject: Mathematical physics **Date:** April 03, 2025 - 11:00 AM **URL:** https://pirsa.org/25040107

Abstract:

The ground state of a bipartite quantum system resembles a thermal state from the perspective of an observer with access to only one of the two regions. This observation has led to the introduction of the entanglement Hamiltonian, which has numerous applications in quantum information and the study of quantum many-body systems.

This talk will explore two approaches to computing the entanglement Hamiltonian: one in the context of quantum field theories (QFTs), focusing on the Bisognano-Wichmann Hamiltonian, and the other for free fermion models on a lattice, where connections with algebraic Heun operators will be highlighted. Additionally, the relationship between the discrete and continuum cases will be examined.

Overview

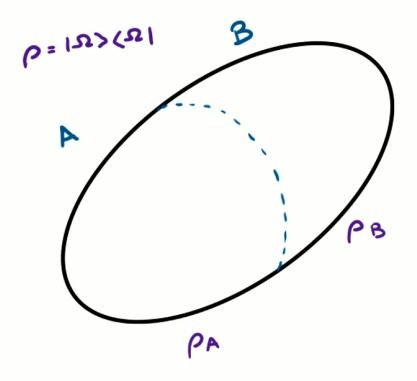

- 1. Motivation
- 2. QFT
- 3. Free Fermions on a lattice
- 4. Continuum limit

lattice models

2/25

Motivation

Reduced density matrix:

$$\rho_A = \operatorname{tr}_B \rho$$

Since ρ_A is positive semi-definite, we can always write:

$$ho_{\mathsf{A}} \propto \mathsf{e}^{-\mathcal{H}}$$

M

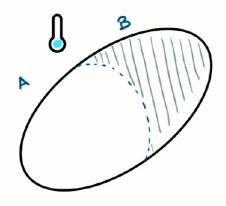

where \mathcal{H} is defined as the **entanglement Hamiltonian** (or modular Hamiltonian).

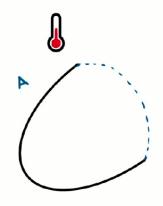

3/25

Pirsa: 25040107 Page 4/26

Motivation

Idea: viewing ρ_A as a **thermal state** of a system governed by a Hamiltonian \mathcal{H} defined solely on \mathcal{A} .

Applications:

• Computation of entanglement entropy:

$$S_A = -\operatorname{tr}_A \rho_A \ln \rho_A$$

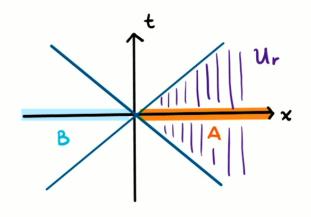

• Ansatz for quantum state tomography:

$$ho_{\mathsf{A}}(ec{g}) \propto e^{-\mathcal{H}(ec{g})}$$

Connection with Unruh effect.

4 / 25

Setting: a 1 + 1d relativistic QFT. The region A is characterized by x > 0. \mathcal{U}_r is the causal complement of B.

[Bisognano and Wichmann, 1975]

The modular operator Δ associated to the vacuum state Ω and the algebra of observable \mathcal{A}_r of the right wedge \mathcal{U}_r is

$$\Delta = e^{-2\pi K}$$

where K is the Lorentz boost generator.

5/25

Corollary

Using Tomita-Takesaki theory, the modular operator Δ can be related to the density matrix as $\Delta = \rho_B^{-1} \otimes \rho_A$. Therefore, we can identify

$$\rho_A \propto e^{-2\pi K_A}, \quad \rho_B \propto e^{-2\pi K_B}$$

where

$$K_A = \int_{x \in A} dx \, x T_{00}(x), \quad K_B = -\int_{x \in B} dx \, x T_{00}(x)$$
 $K = K_A - K_B = \int dx \, x T_{00}(x)$

Note: K_A is known as **Bisognano-Wichmann Hamiltonian**. We have the identification $\mathcal{H} = 2\pi K_A$.

6/25

Alternative path integral approach [Witten, 2018]:

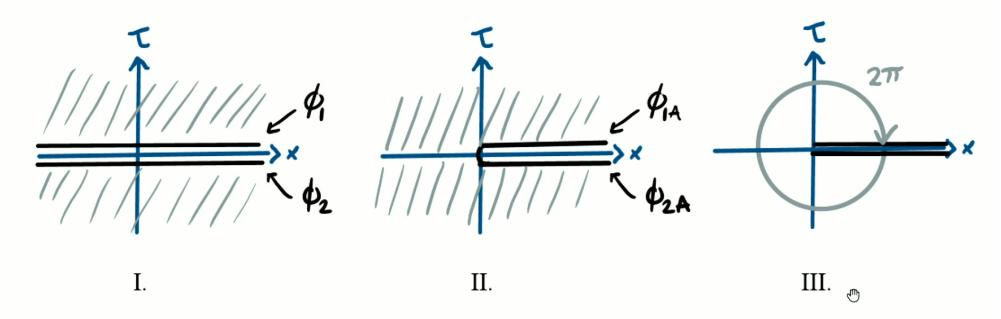

$$\rho[\phi_1, \phi_2] = \int_{\phi(x,0) = \phi_1(x)} D\phi e^{-S_E[\phi]} \int_{\phi'(x,0) = \phi_2(x)} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0^+) = \phi_1(x) \\ \phi(x,0^-) = \phi_2(x)}} D\phi e^{-S_E[\phi]} \int_{\phi'(x,0) = \phi_2(x)} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0^+) = \phi_1(x) \\ \phi(x,0^-) = \phi_2(x)}} D\phi e^{-S_E[\phi]} \int_{\substack{\phi(x,0) = \phi_2(x) \\ \phi(x,0^-) = \phi_2(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0^-) = \phi_2(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_2(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_2(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_2(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_2(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_2(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_2(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_2(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_2(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_2(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_2(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_E[\phi']} = \int_{\substack{\phi(x,0) = \phi_1(x) \\ \phi(x,0) = \phi_1(x)}} D\phi' e^{-S_$$

We have $\phi_i = \phi_{i,B} \oplus \phi_{i,A}$. Taking the partial trace amounts to ask $\phi_{1,B} = \phi_{2,B}$.

$$\rho_{A}[\phi_{1,A},\phi_{2,A}] = \int_{\substack{\phi_{A}(x,0^{+}) = \phi_{1,A}(x) \\ \phi(x,0^{-}) = \phi_{2,A}(x)}} D\phi e^{-S_{E}[\phi]}$$

The Hamiltonian interpretation of this path integral is a 2π rotation in the plane τx . In terms of the real time $t=-i\tau$, this is a Lorentz boots $e^{-2\pi K}$.

7/25

Remark: This identification was made possible by the choice of region A and the presence of a continuous symmetry group.

$$\mathcal{H}=2\pi\int_{x\in A}dx\,xT_{00}(x)$$

8 / 25

Different geometries (CFT case)

Question: What happens for theories defined on a different geometry? What about a different choice of subsystem *A*?

Example: Consider a CFT, on a finite interval $(x, t) \in [0, L] \times \mathbb{R}$. The subsystem $A = [x_0, L]$. Let z = x + it and consider the following map induced by

$$w = f(z) = \ln\left(\frac{\sin\frac{\pi(z-x_0)}{2L}}{\sin\frac{\pi(z+x_0)}{2L}}\right)$$

Reduced density matrix $\rho_A \to$ thermal state on annulus. Back to original coordinates:

$$\mathcal{H} = 2\pi \int_{A} \beta(x) T_{00}(x) dx, \quad \beta(x) = \frac{L}{\pi} \frac{\cos \frac{\pi x_0}{L} - \cos \frac{\pi x}{L}}{\sin \frac{\pi x_0}{L}}.$$

9/25

We consider the Heisenberg XX (or free fermions) model :

$$\mathbf{H} = -\frac{1}{2} \sum_{n} J_{n} (\sigma_{n}^{x} \sigma_{n+1}^{x} + \sigma_{n}^{y} \sigma_{n+1}^{y}) - \frac{1}{2} \sum_{n} \mu_{n} (1 + \sigma_{n}^{z}),$$

which using Jordan-Wigner transformation is mapped onto

$$\boldsymbol{H} = \sum_{n} J_{n} \left(c_{n}^{\dagger} c_{n+1} + c_{n+1}^{\dagger} c_{n} \right) - \sum_{n} \mu_{n} c_{n}^{\dagger} c_{n},$$

where $\{c_m, c_n\} = \{c_m^{\dagger}, c_n^{\dagger}\} = 0$ and $\{c_m, c_n^{\dagger}\} = \delta_{mn}$. To solve this model, it is convenient to express the Hamiltonian in matrix form.

$$m{H}=m{c}^{\dagger} J m{c}, \quad m{c}^{\dagger}=(c_1^{\dagger},c_2^{\dagger},\ldots,c_N^{\dagger}), \quad J=egin{pmatrix} -\mu_1 & J_1 & 0 & \ldots \ J_1 & -\mu_2 & J_2 & \ldots \ 0 & J_2 & -\mu_3 & \ldots \ dots & dots & dots & dots & dots \end{pmatrix}$$

10 / 25

Idea: Diagonalize J

$$UJU^T = diag(\omega_1, \omega_2, \dots, \omega_N), \quad U^TU = \mathbf{1}$$

Let $b_k = (U\boldsymbol{c})_k = \sum_i U_{ki}c_i$, then

$$\mathbf{H} = \mathbf{c}^{\dagger} J \mathbf{c} = \mathbf{c}^{\dagger} U^{T} U J U^{T} U \mathbf{c} = \sum_{k} \omega_{k} b_{k}^{\dagger} b_{k}$$

Observation: Favard's theorem states that three term recurrence are solved by orthogonal polynomials. Since J is a tridiagonal matrix, the entries of U can be expressed in terms of orthogonal polynomials:

$$U_{ki} \propto P_i(\omega_k)$$
.

Ground state: Let the vacuum state be denoted by $|0\rangle$ and $\omega_k < \omega_{k+1}$. Let K be the largest integer k such that $\omega_k < 0$, then the ground state $|\Omega\rangle$ is given by

$$|\Omega\rangle = b_1^{\dagger} \dots b_K^{\dagger} |0\rangle$$
.

11 / 25

[Peschel, 2003]

The entanglement Hamiltonian for the ground state of a lattice free fermion model is given by

$$\mathcal{H}=\sum_{ij\in\mathcal{A}}h_{ij}c_i^{\dagger}c_j,$$

where h is an $|A| \times |A|$ matrix given in terms of an $|A| \times |A|$ truncated correlation matrix C

$$h=\ln\left(rac{1-C}{C}
ight), \quad C_{ij}=\left\langle\Omega
ight|c_{i}^{\dagger}c_{j}\left|\Omega
ight
angle.$$

Sketch of proof: All higher correlation can be expressed in terms of two point correlation. Wick's theorem \rightarrow true for gaussian fermionic states. We can identify h using

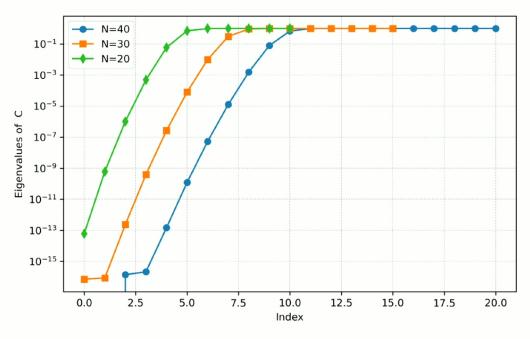

$$\frac{\operatorname{tr}(e^{-\mathcal{H}}c_i^{\dagger}c_j)}{\operatorname{tr}(e^{-\mathcal{H}})}=C_{ij}.$$

12 / 25

Computing *C*: we have

$$C_{ij} = \langle \Omega | c_i^{\dagger} c_j | \Omega \rangle = \sum_{k \leq K} U_{ki} U_{kj}$$

Observation: we have the issue that *C* is ill-conditioned.

9

13 / 25

[Eisler and Peschel, 2013] [Grünbaum et al., 2018] [Crampé et al., 2019]

If there exists a non-degenerate diagonal matrix X acting tridiagonally on the eigenbasis of the one-particle Hamiltonian J, then there exists a region A and coefficients μ and ν such that $[\mathcal{T}, C] = 0$, where

$$\mathcal{T} = JX + XJ + \mu J + \nu X.$$

Sketch of proof: The truncated correlation matrix can be factorized in terms of projectors π_K and π_A onto the eigenspaces of J and X respectively:

$$C = \sum_{k \le K} U_{ki} U_{kj} = \pi_A \pi_K \pi_A$$

Two bases: one where J diagonal and X tridiagonal, one where J tridiagonal and X diagonal. In two bases, \mathcal{T} tridiagonal.

$$[\mathcal{T}, \pi_K] = 0 \Rightarrow \text{constraint on } \nu, \quad [\mathcal{T}, \pi_A] = 0 \Rightarrow \text{constraint on } \mu.$$

14 / 25

Remarks:

• In general, \mathcal{T} is a tridiagonal matrix, well-conditioned.

$$h = a_0 + a_1 \mathcal{T} + a_2 \mathcal{T}^2 + ...$$

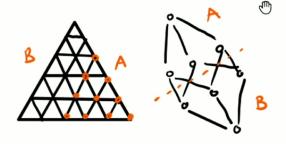

Very good approximation:

$$h pprox a_0 + a_1 \mathcal{T}$$

- Originates from the work [Slepian and Pollak, 1961] on time and band limiting.
- Generalizations: hyperplane lattices, Distance-regular graphs.

15 / 25

Pirsa: 25040107 Page 16/26

Remarks:

• In general, \mathcal{T} is a tridiagonal matrix, well-conditioned.

$$h = a_0 + a_1 T + a_2 T^2 + ...$$

Very good approximation:

$$h \approx a_0 + a_1 \mathcal{T}$$

- Originates from the work
 [Slepian and Pollak, 1961] on time
 and band limiting.
- Generalizations: hyperplane lattices, Distance-regular graphs.

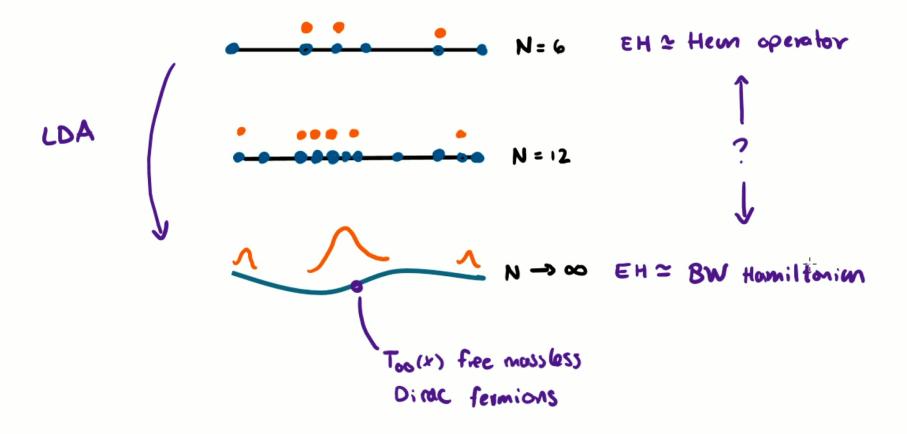

- The pairs (J, X) are classified (Leonard pairs). One-to-one correspondence with q-Racah polynomials.
- Diagonalizing $\mathcal{T} \Rightarrow$ algebraic Bethe anstaz.
- In certain cases, \mathcal{T} can be identified with differential Heun operator.

$$rac{d^2w}{dz^2}+\left[rac{\gamma}{z}+rac{\delta}{z-1}+rac{\epsilon}{z-a}
ight]rac{dw}{dz}+rac{lphaeta z-q}{z(z-1)(z-a)}w=0.$$

16/25

Pirsa: 25040107 Page 17/26

Continuum limit

Pirsa: 25040107

17 / 25

Continuum limit

Formal procedure for continuum limit: free fermions on a chain \rightarrow free massless Dirac fermions in a curved background.

$$x = (n+1)N^{-1}, \quad J_n \to NJ(x), \quad \mu_n \to N\mu(x)$$

$$c_n \to \frac{1}{\sqrt{N}} \left(e^{i\varphi(x)} \psi_R(x) + e^{-i\varphi(x)} \psi_L(x) \right), \quad \varphi(x) = \int^x q_F(x) dx$$

Space-dependent Fermi velocity $v_F(x)$, Fermi momentum $q_F(x)$ and dispersion relation

$$q_F(x) = \pm \arccos(\mu(x)/2J(x)), \quad \omega_q = 2J(x)\cos q - \mu(x).$$

$$v_F = \left| \frac{\mathrm{d}\omega_q(x)}{\mathrm{d}q} \right|_{q_F(x)} = \sqrt{4J(x)^2 - \mu(x)}$$

18 / 25

Pirsa: 25040107 Page 19/26

Continuum limit

This leads to

$$\mathbf{H} = \sum_{i,j} [J]_{ij} c_i^{\dagger} c_j \xrightarrow[N \to \infty]{} \int_0^1 v_F(x) T_{00}(x) dx$$

where

$$T_{00}(x) = \frac{1}{2} \left[\psi_R^{\dagger}(x)(-i\partial_x)\psi_R(x) - \psi_L^{\dagger}(x)(-i\partial_x)\psi_L(x) + \text{h.c.} \right].$$

Similarly, we find for the entanglement Hamiltonian based on the Heun operator ${\mathcal T}$

$$\sum_{i,j\in A} [a_0 + a_1 \mathcal{T}]_{ij} c_i^{\dagger} c_j \xrightarrow[N\to\infty]{} \int_{\mathcal{A}} \beta_{Heun}(x) v_F(x) \mathcal{T}_{00}(x) dx$$

[Eisler et al., 2019] [Bonsignori and Eisler, 2024] [Bernard et al., 2024]

In all cases studied, the factor $\beta_{Heun}(x)$ from the **continuum limit of the Heun operator** matches the coefficient $\beta_{CFT}(x)$ predicted by conformal field theory (CFT) in curved spacetime.

19/25

Pirsa: 25040107 Page 20/26

Example: Krawtchouk chain

Setting: Pair $(J, X) = (S^x, S^z)$ where S^x and S^z are $(N+1) \times (N+1)$ matrices from an irreducible representation of $\mathfrak{su}(2)$ in the basis where S^z is diagonal.

$$\mathbf{H} = \sum_{n} J_n \left(c_n^{\dagger} c_{n+1} + c_{n+1}^{\dagger} c_n \right) - \sum_{n} \mu_n c_n^{\dagger} c_n,$$

$$J_n = \frac{1}{2}\sqrt{(n+1)(N-n)}, \quad \mu_n = 0, \quad v_F(x) = \sqrt{x(1-x)}$$

Heun operator (A = half-chain):

$$\mathcal{T} = \{S^x, S^z\}$$

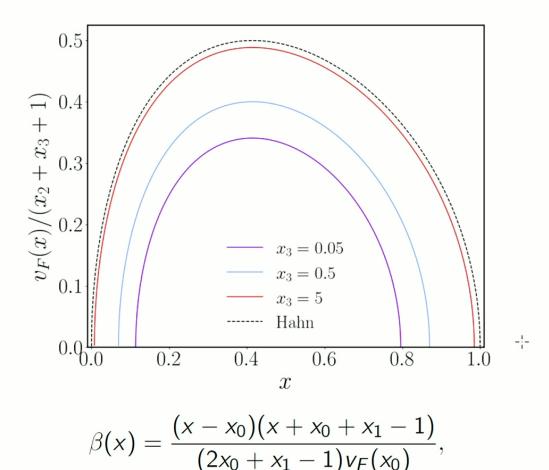

$$\beta_{Heun}(x) = \beta_{CFT}(x) = \frac{\tilde{L}}{\pi} \frac{\cos \frac{\pi \tilde{x}_0}{\tilde{L}} - \cos \frac{\pi \tilde{x}(x)}{\tilde{L}}}{\sin \frac{\pi \tilde{x}_0}{\tilde{L}}} = \frac{x - x_0}{v_F(x_0)}$$

Outlook

Pratical applications

- Provides a scheme to fix a_0 and a_1 in the approximation $h \approx a_0 + a_1 \mathcal{T}$
- (Bonsignori and Eisler, 2024)
 Discretization of BW Hamiltonian for new (almost) commuting operator T for time and band limiting?

Open questions:

- ullet Diagonalization of ${\mathcal T}$
- q-Racah case and other generalizations
- Proof for a_0 and a_1 without using CFT argument.
- XY model, MVOPs.
